# Building Water Resiliency: ASR Project Updates City of Temple and Fort Hood

Neil Deeds, PhD, PE, PG  
David Smith

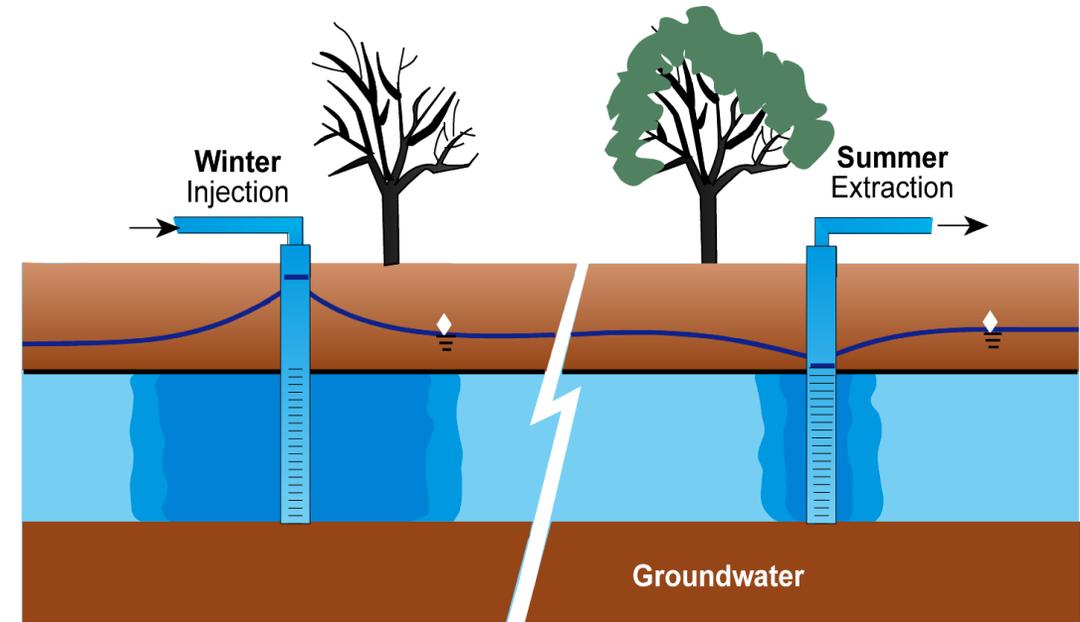

11/19/2025

# Outline

---

- Need For Resiliency
- ASR Concepts
- Why the Hosston Aquifer?
- Fort Hood: Phased ASR Implementation
- City of Temple: Evaluating ASR Wellfield Layouts and Options for using Advance Treated Wastewater

# Need for Resiliency

---

# Background: Fort Hood

- Establishment Year: 1942
- Size: Approximately 214,968 acres
- Active Duty Personnel: Around 36,000
- Primary Purpose: It serves as a key location for U.S. Army's armored operations, combat training, and mobilization.

— County Boundaries    ■ Fort Hood    ■ Ranges  
— Major Roads    □ Cities    ■ Training Areas

0 1 2 4 6 Miles

# Project Objectives: Fort Hood

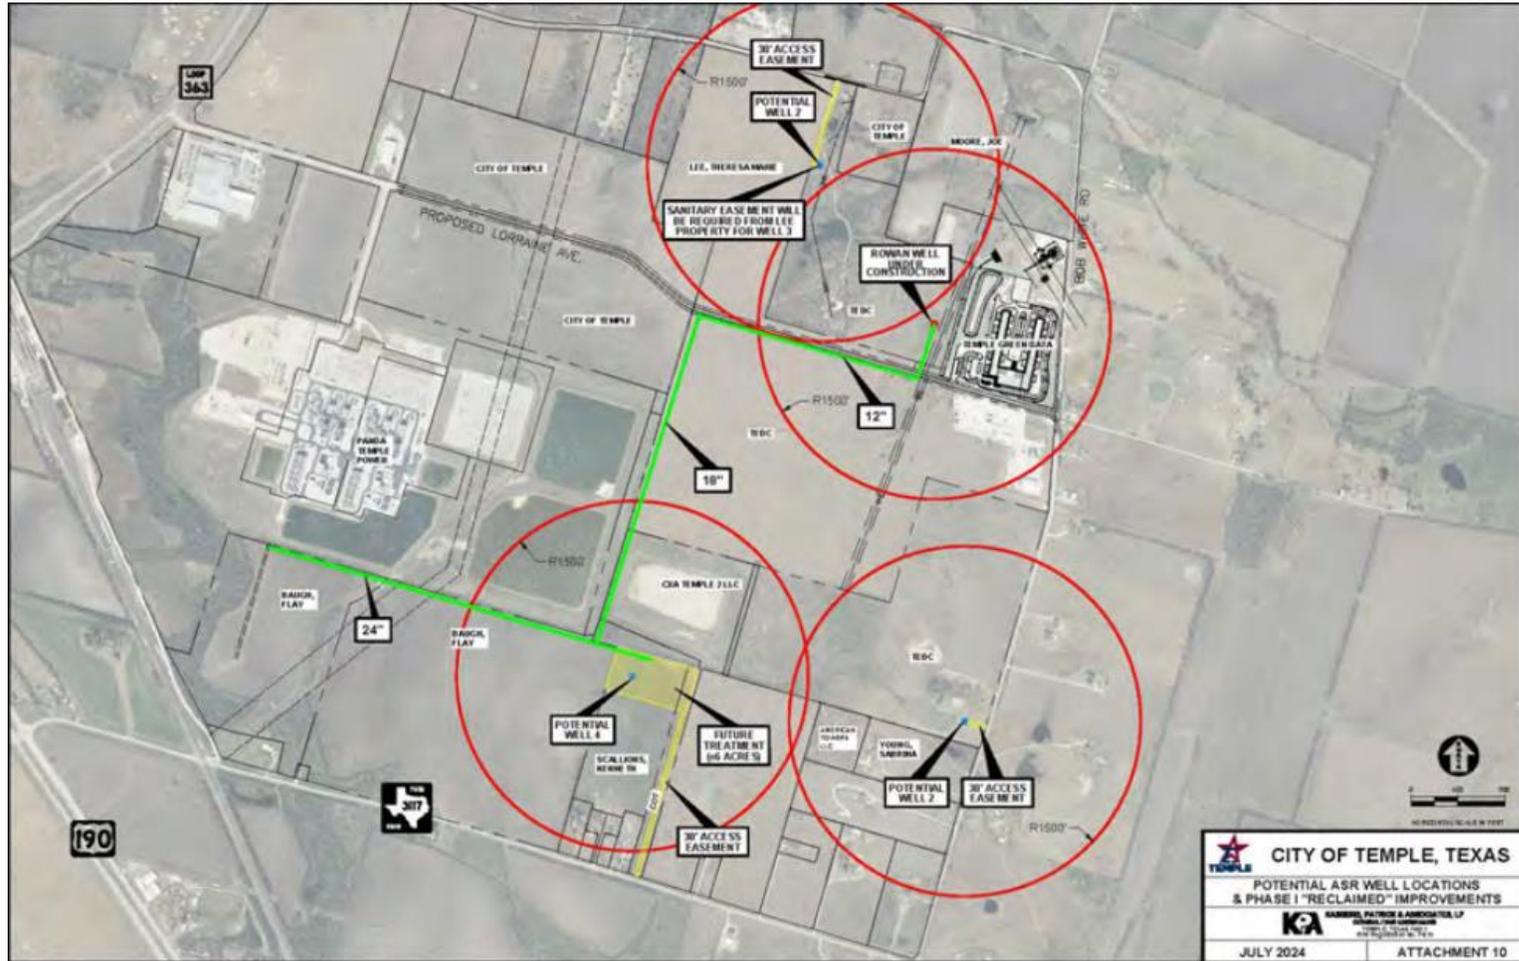

- Provide the Army with a redundant source of drinking water, located on post, and available for use in case of drought or emergency
- Increase Fort Hood's resiliency in support of Soldiers, units and families
- Provides value to neighboring communities by reducing water demand in times of need

*(Photo Credit: Sgt. Kaden Pitt)*

*From 2025 FCTX ASR Concept, Brian Dosa, Director of the Directorate of Public Works*

# Project Objectives: City of Temple, Developing ASR to meet Significant Industrial Demand

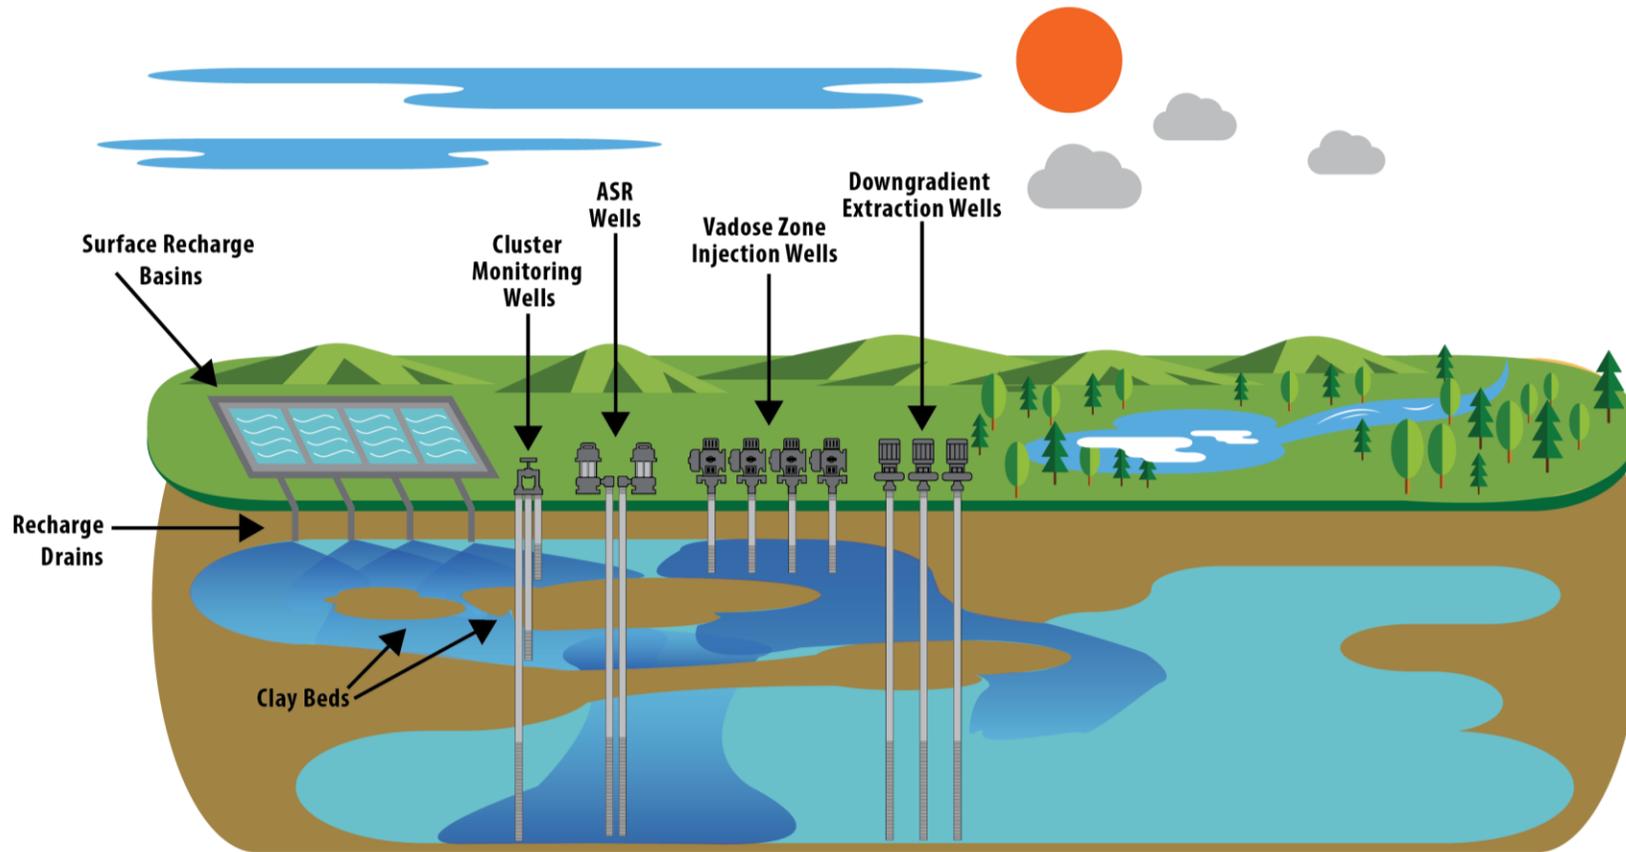

- Long-term, surface water resources may struggle to meet projected peak week industrial demands
- A practical solution, use treated wastewater for non-potable industrial use
- ASR will balance demand variability by storing water when available and recover during high demand periods
- Design and permitting in place for a four-well ASR system, initially using treated surface water and later converted to reclaim water recharge when permit steps are in place

# ASR Concepts

---

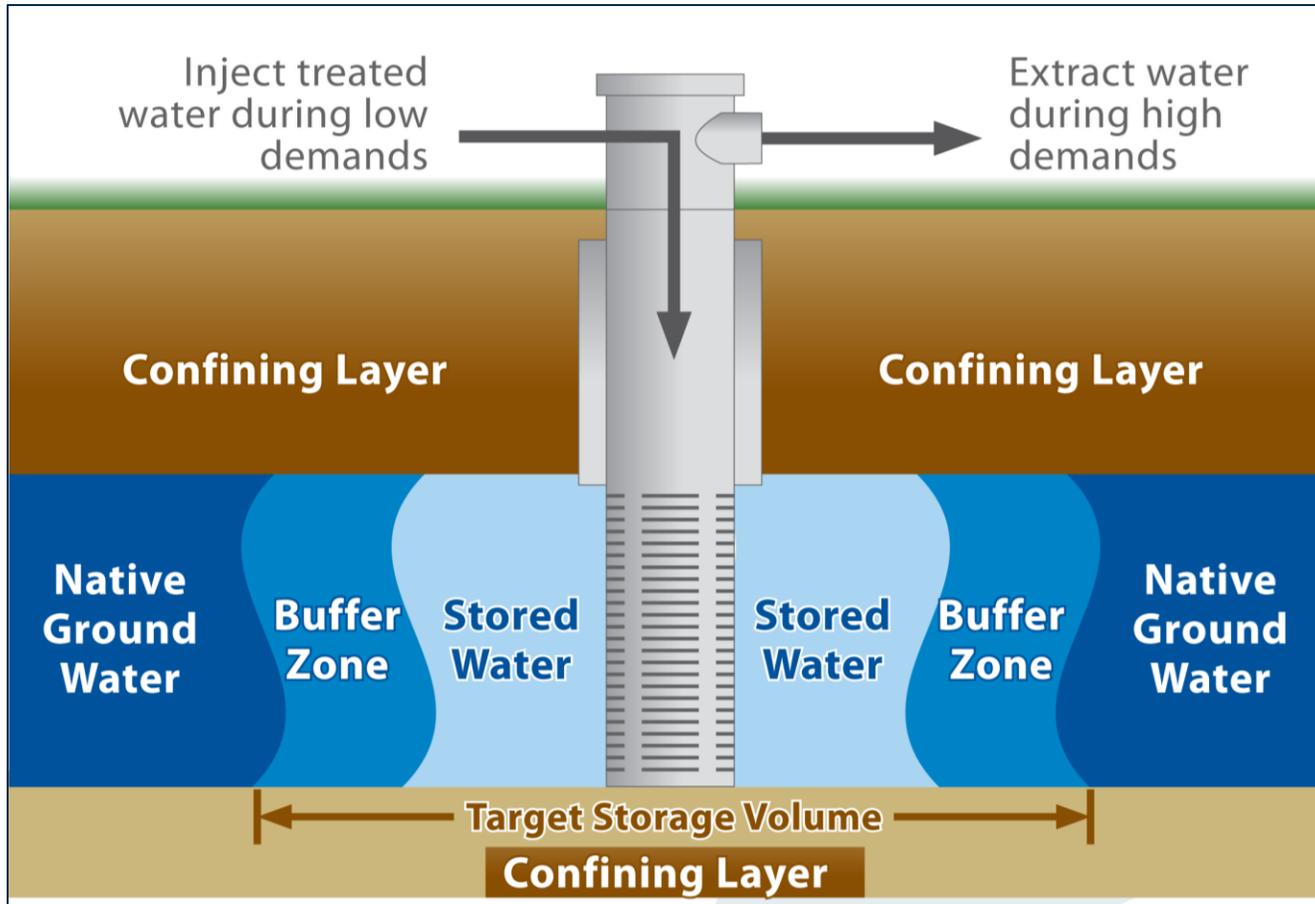

# Aquifer Storage Recovery (ASR) Defined

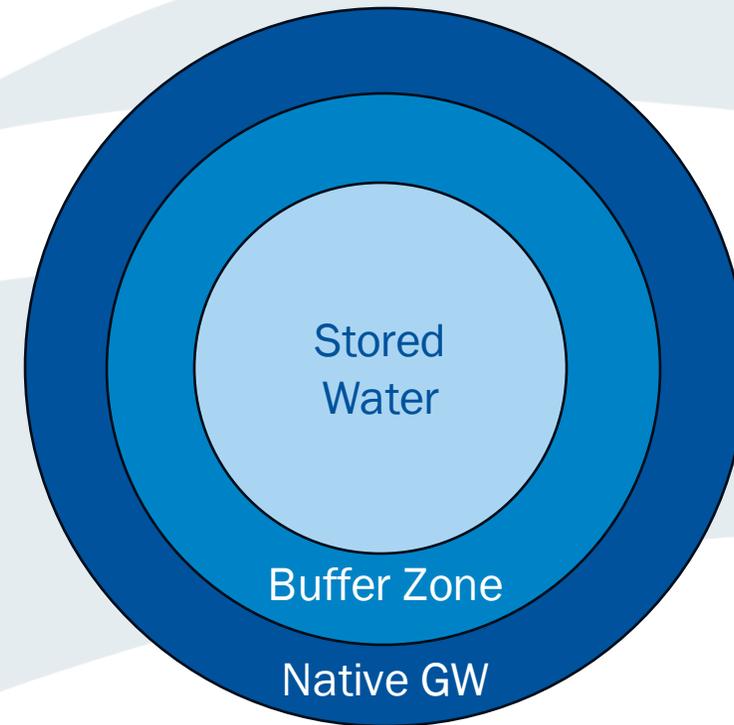

- *ASR is one of several managed aquifer recharge (MAR) technologies tailored to the hydrogeologic environment*
- *Typically, a multi-purpose well is used to store water in an aquifer, and the water is then retrieved when needed using the same well*

# ASR: Concepts

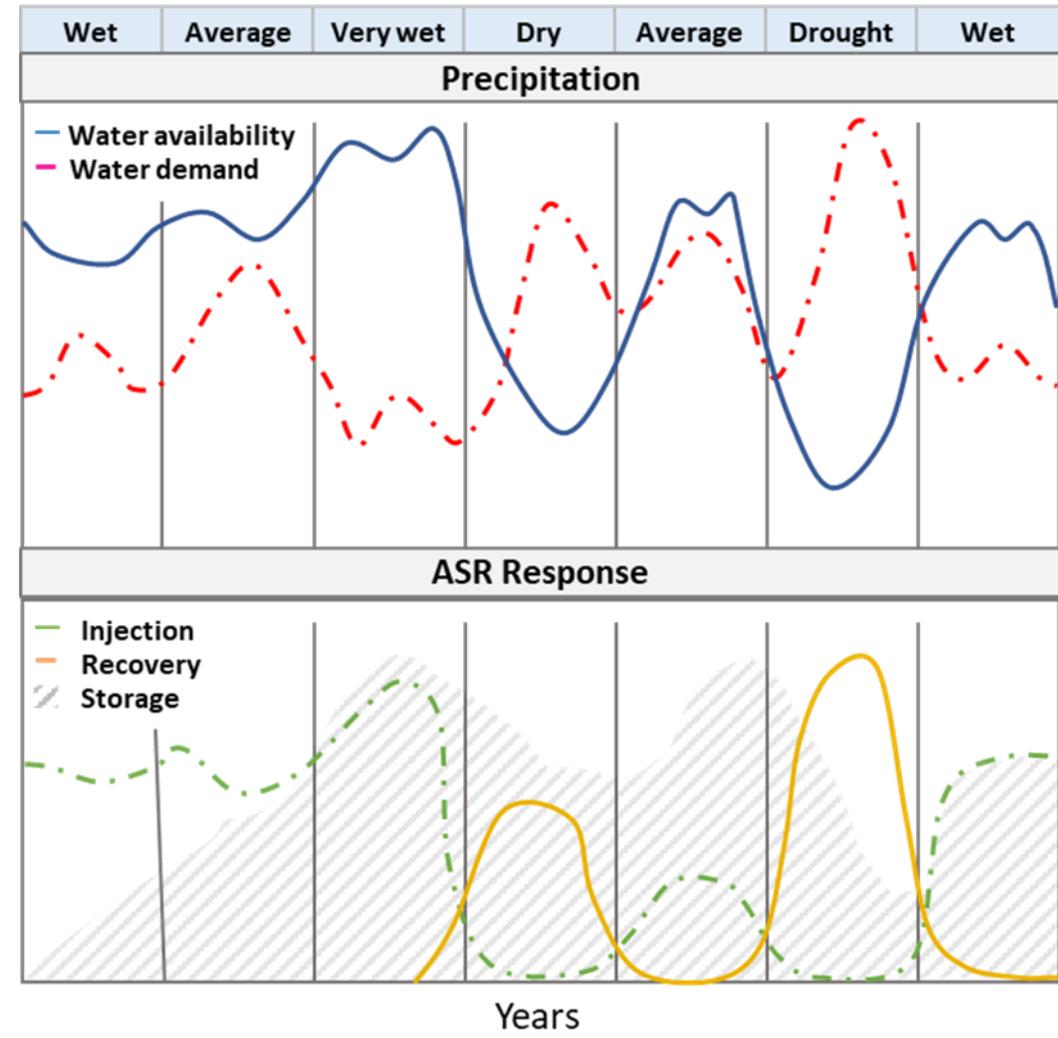

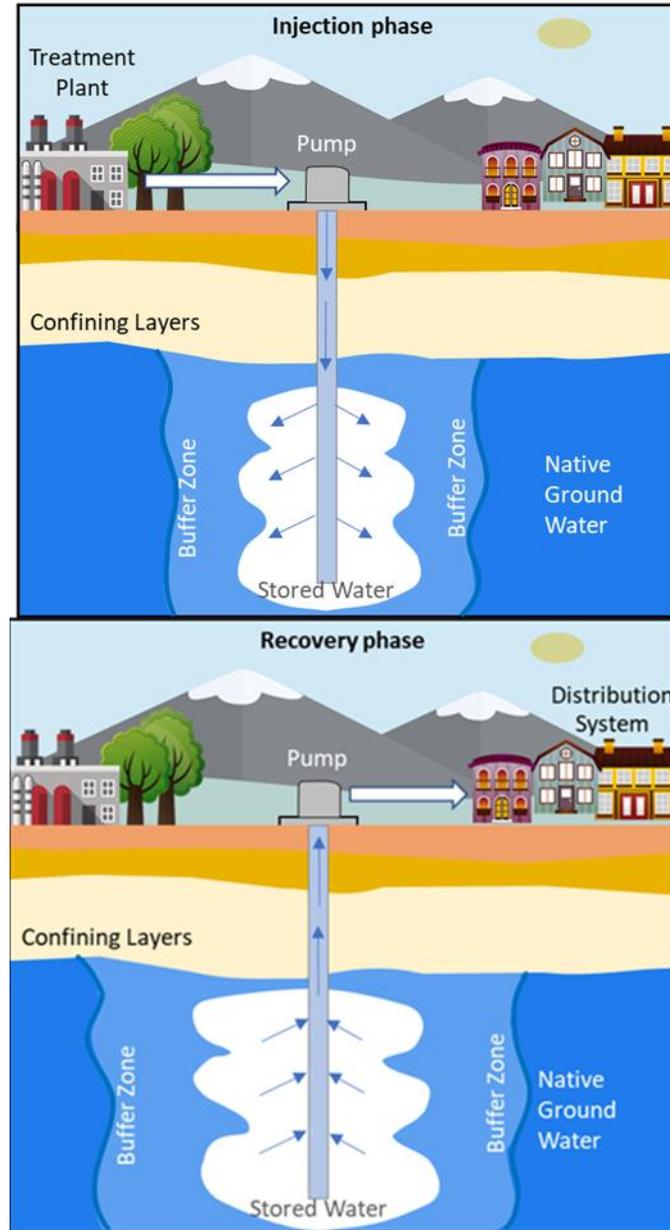

**Aquifer Storage and Recovery** [30 TAC §331.2(8)]: “The injection of water into a geologic formation, group of formations, or part of a formation that is capable of underground storage of water for later retrieval and beneficial use.”

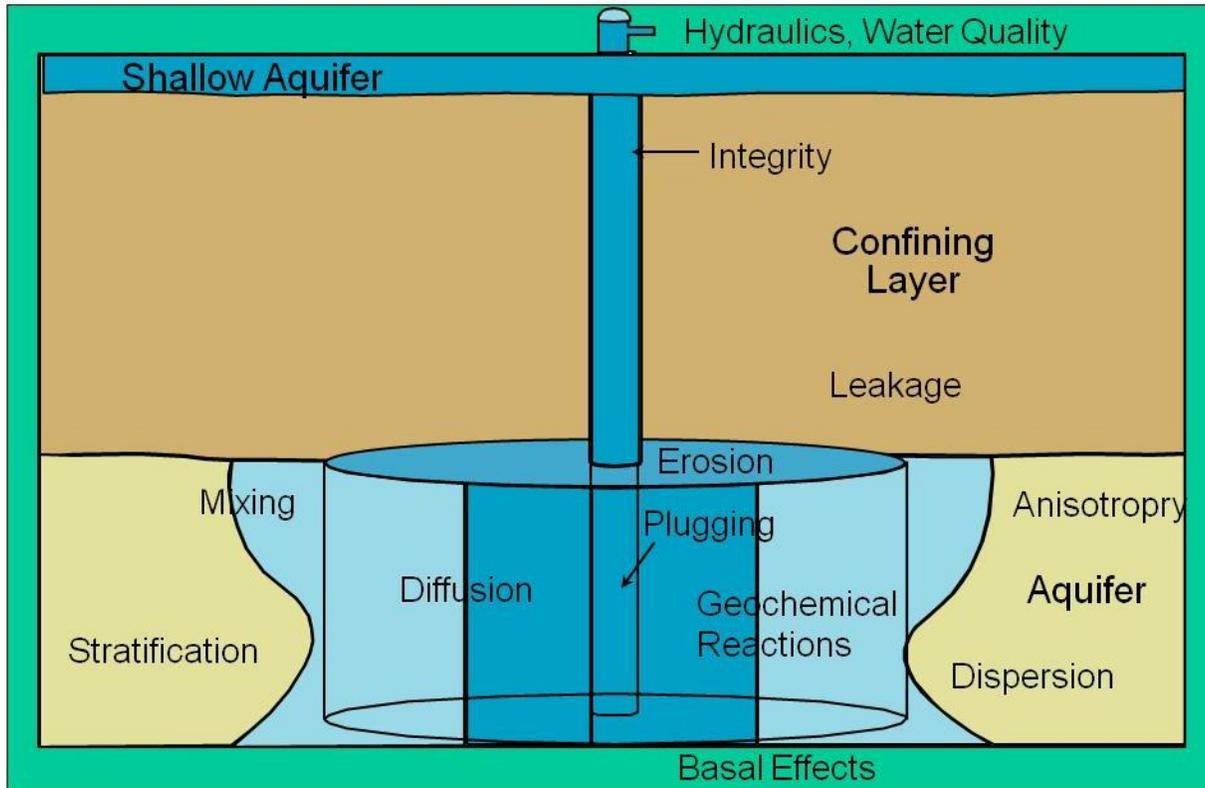

Top View of ASR “Bubble”

# ASR Operation Example

# Implementation

*“Concept is simple, but carefully phased implementation is preferable to ensure technical challenges are overcome”*

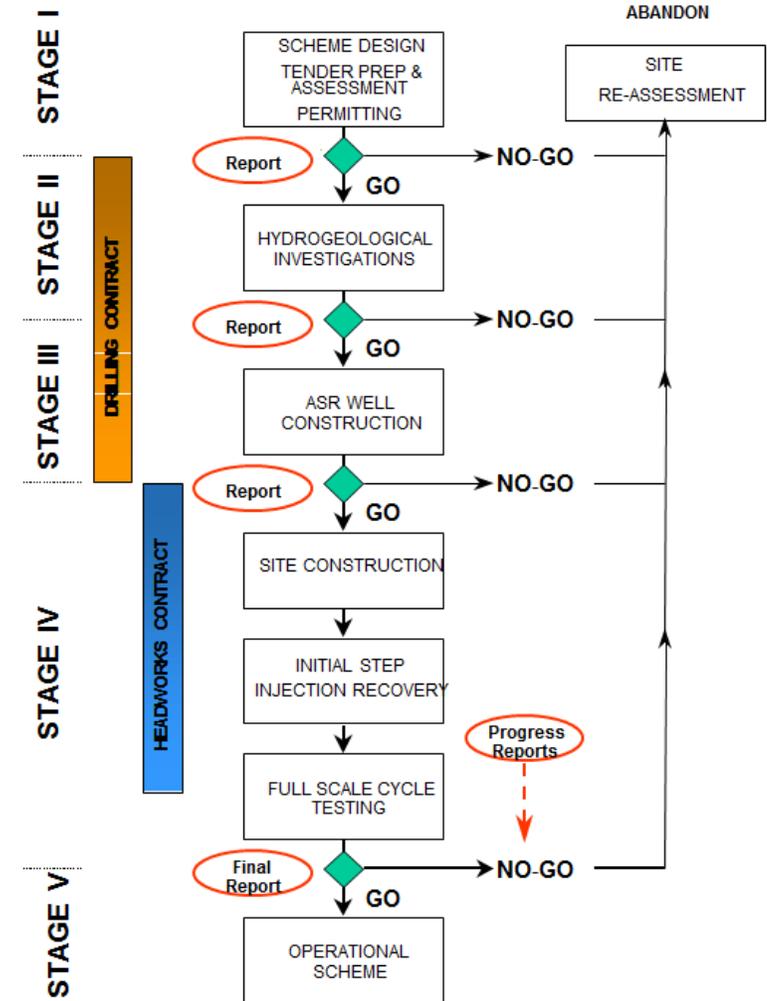

# The Approach for ASR / MAR

## • Planning / Concept

- Integrated Water Resource Planning, incl Climate Change Scenarios
- Source Water Evaluations (Stormwater Capture, Reclaim Water)
- ASR Workshops
- Water Demand Projections
- Defining Recharge Objectives
- Hydrogeologic Evaluations, Geophysics
- Groundwater Modeling
- Geochemical Modeling
- Engineering, incl Planning Level Costs

## • Implementation

- Design (“Groundwater Engineering”)
- Permitting and Stakeholder Participation
- Test Drilling, ASR Wells
- Facility Construction
- Start-Up, System Integration, (Pilot) Testing and Reporting
- Operational Guidance / Training

# Why the Lower Trinity/Hosston?

---

# Hosston Aquifer: We are still learning

---

- **Important Note: The “Hosston” and the “Lower Trinity” are names for the same aquifer**
- At the Fort Hood site, the characteristics of the Hosston were largely unknown prior to the aquifer testing program
- At the Temple site, we knew the Hosston was likely to be productive, but how productive?
- Suitability for ASR first explored during the county-wide ASR study commissioned by CUWCD and other key stakeholders in Bell County

Fort Hood Site

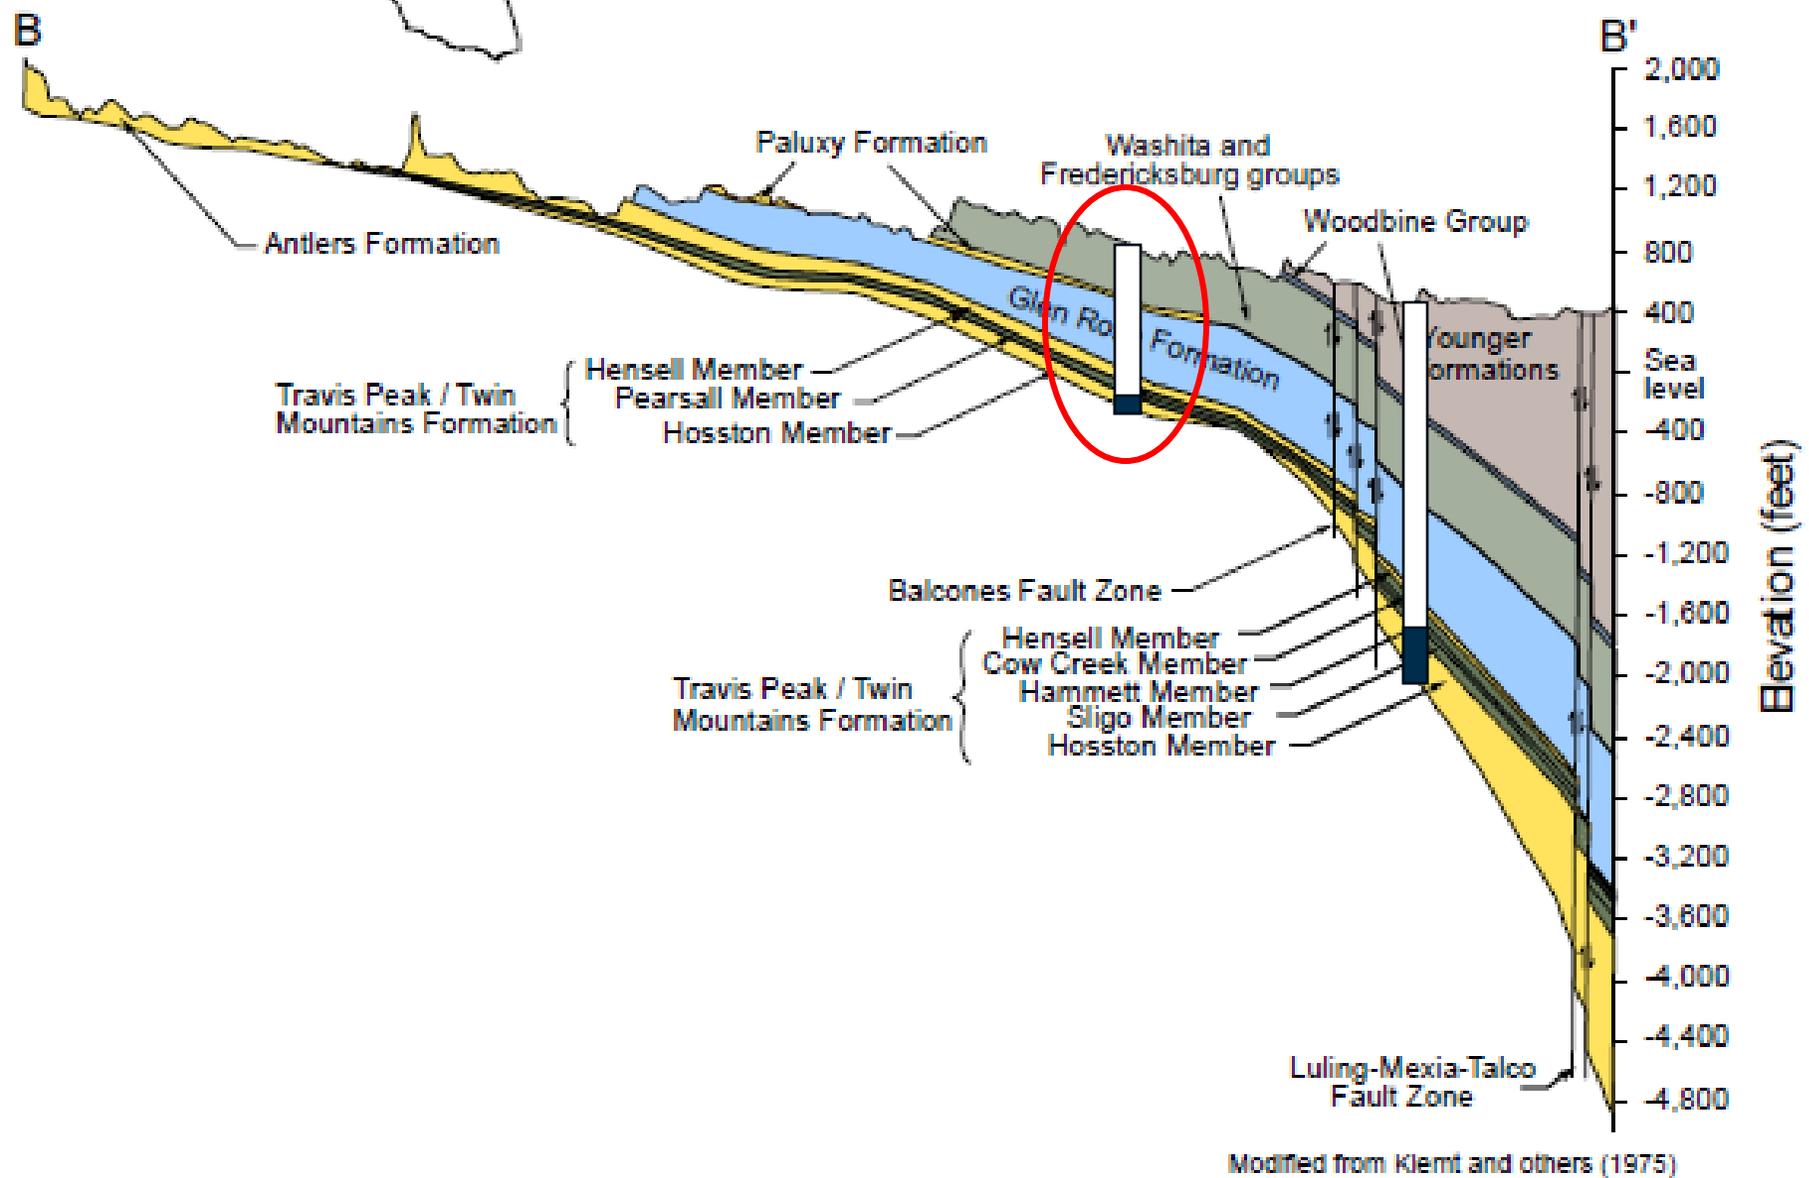

Well Depth = 1,000 ft

about 16 miles

Temple Site

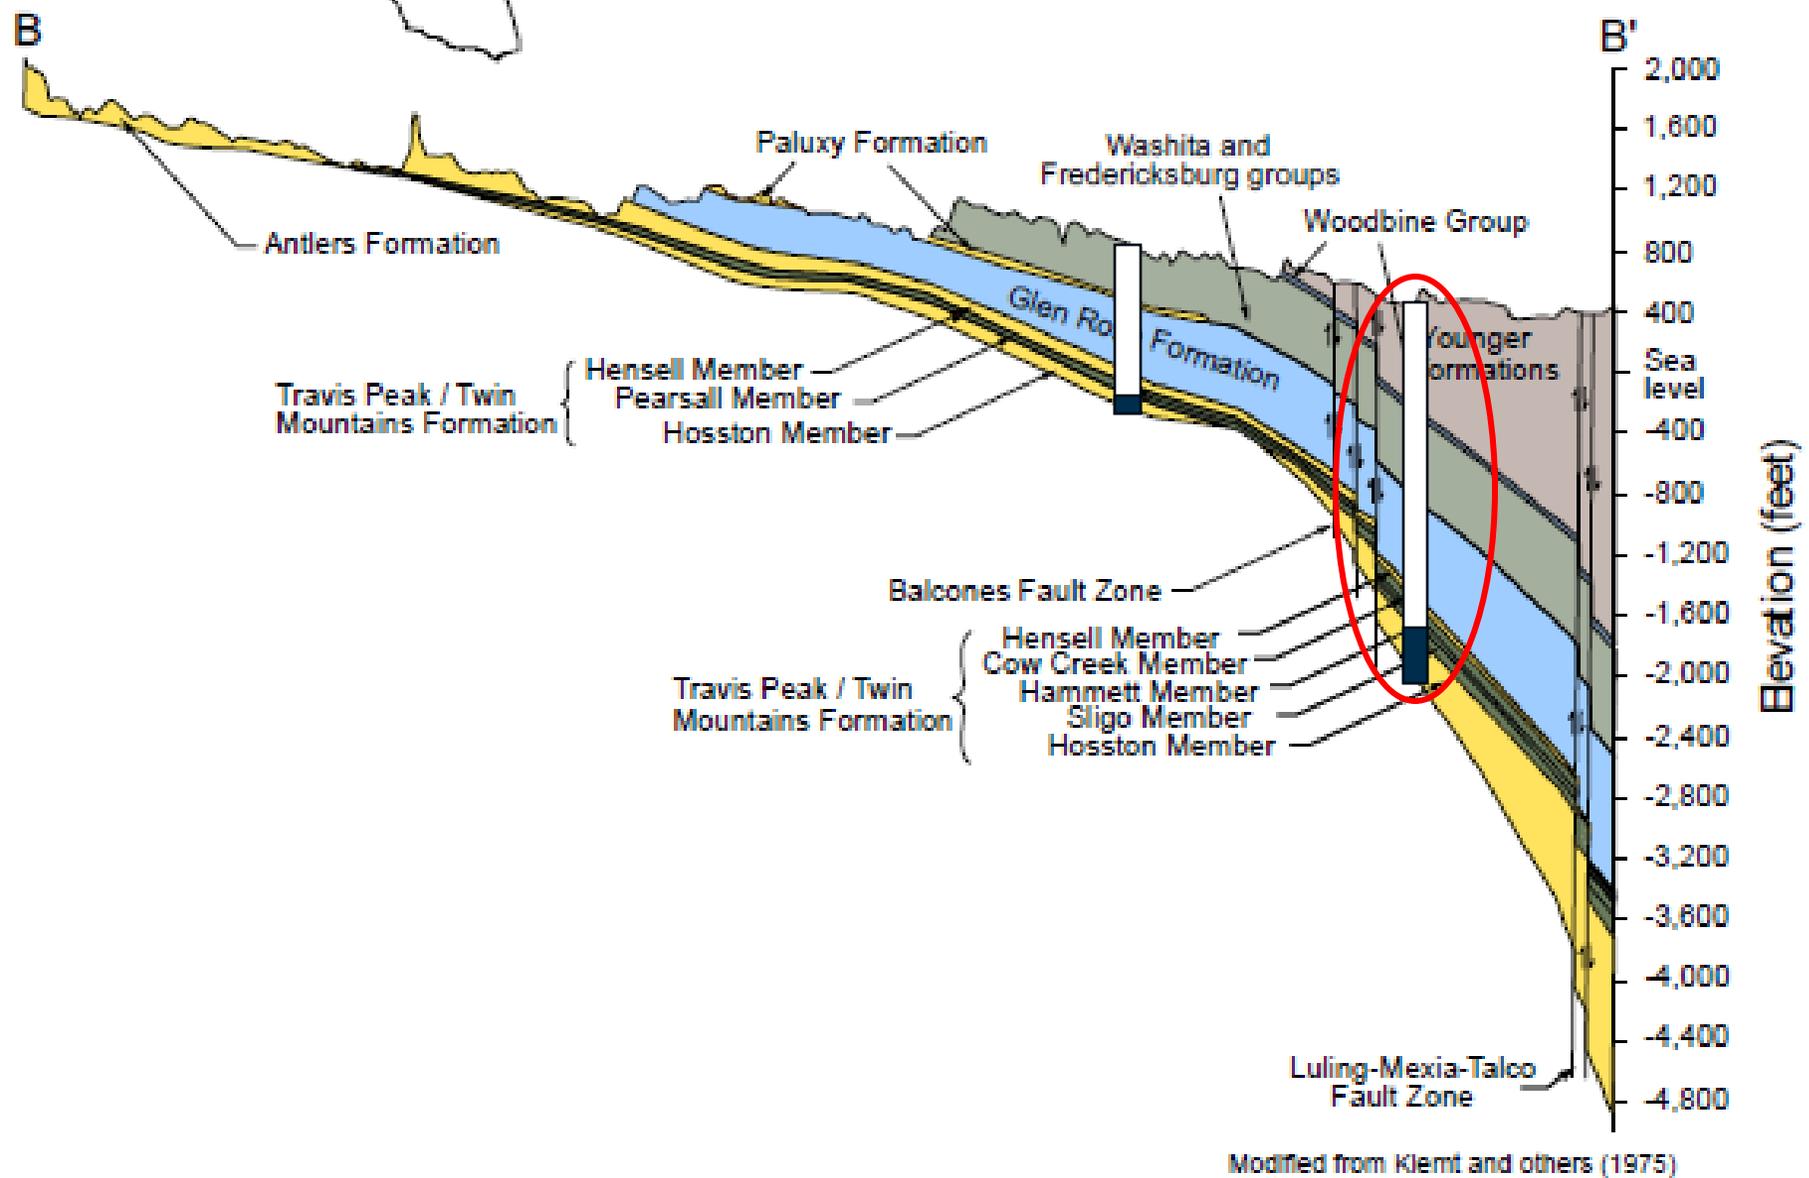

Well Depth = 2,500 ft

This dip section is north of Bell County, but reasonably representative

Figure 2.2.3 Cross sections of the stratigraphic units in the study area (after George and others, 2011; Bené and others, 2004; Nordstrom, 1982; Klemt and others, 1975).

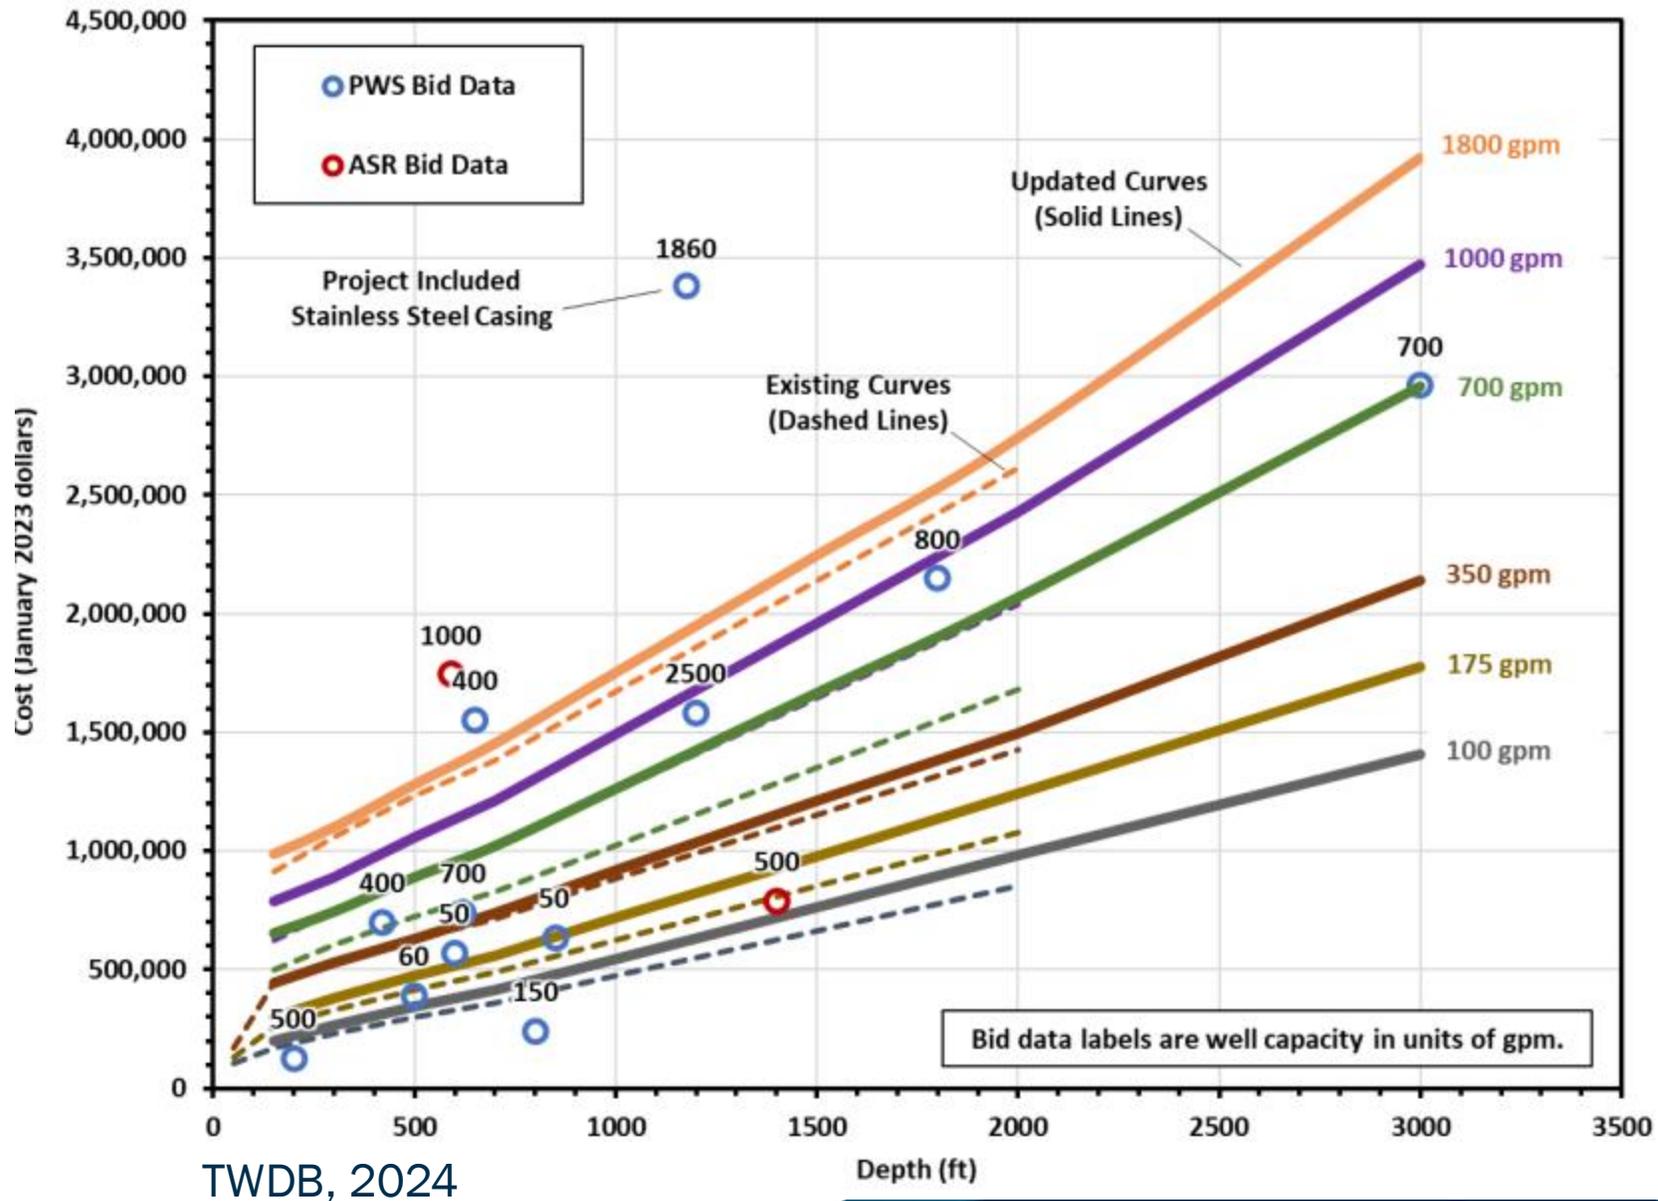

This dip section is north of Bell County, but reasonably representative

Figure 2.2.3 Cross sections of the stratigraphic units in the study area (after George and others, 2011; Bené and others, 2004; Nordstrom, 1982; Klemt and others, 1975).

# Comparison

- Ft Hood
  - Lower per-well rates
  - “Easy” drilling
  - UCM estimate ~\$1 million/well (cheaper for multi-well program)
- Temple
  - Higher productivity, more “large project” potential
  - Challenging to drill (fewer contractors available with capabilities)
  - UCM estimate >\$3 million/well

# Fort Hood

---

# Site Map: Fort Hood

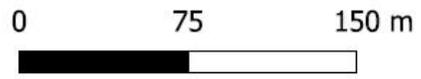

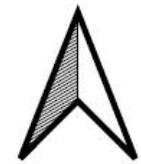

Tank Trail, do not park on it

Buried 54" Pipeline

monitor well  
31.12799373, -97.55555124

test well  
31.1273862, -97.55400723

Goal of well locations:  
1. ~500' apart  
2. Work not obstructing tank trail

# Monitor Well: Findings

---

- Four-inch exploratory well marked a decision point on whether to proceed with the pumping well
- We found no “fatal flaws”
  - **Potential fatal flaw #1:** The Hosston/Lower Trinity is not present, or very thin.
  - *Finding: The Hosston is present (although deeper than expected), and a minimum 60' thick.*
  - **Potential fatal flaw #2:** The lithology in the Hosston has high percentage of clays/shales.
  - *Finding: Composed of well-sorted, fairly clean sand.*
  - **Potential fatal flaw #3:** The static water level is too deep
  - *Finding: The static water level is 485' below ground surface, leaving 430' of available drawdown for production*

Depth (ft bgs)	Lab Sample	Lithology	Lithologic Description	Depth (ft bgs)
----------------	------------	-----------	------------------------	----------------

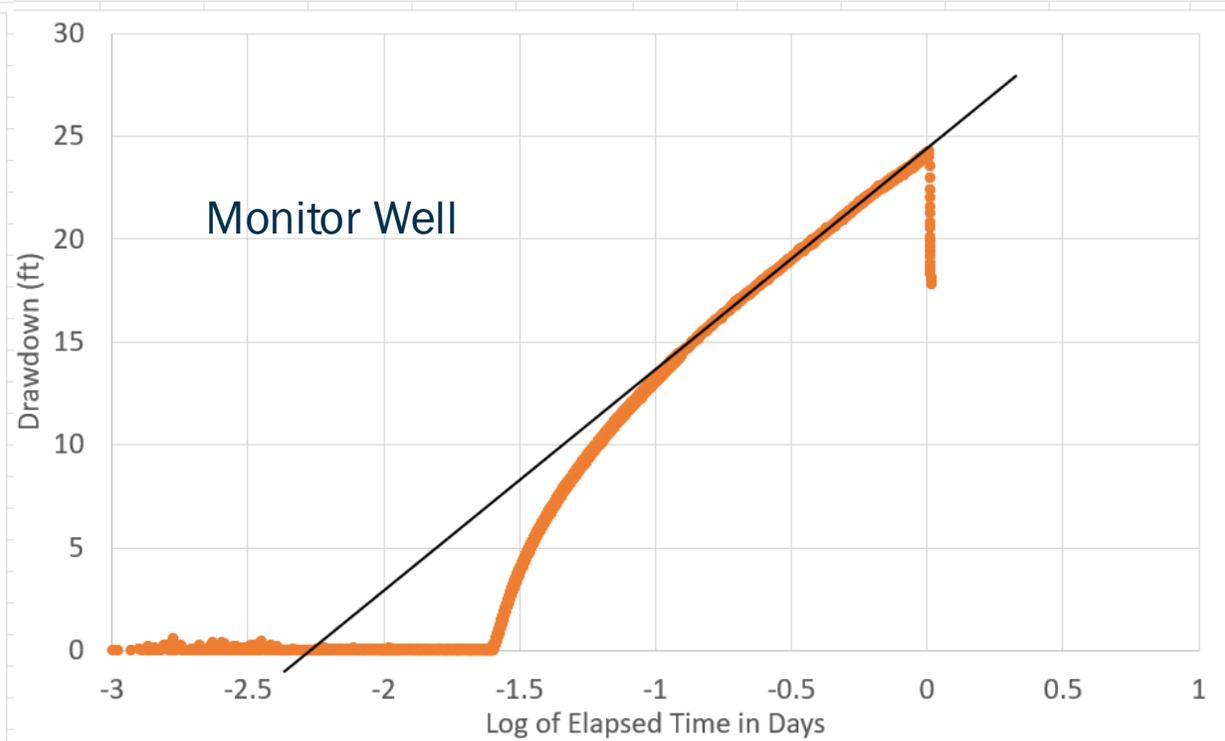

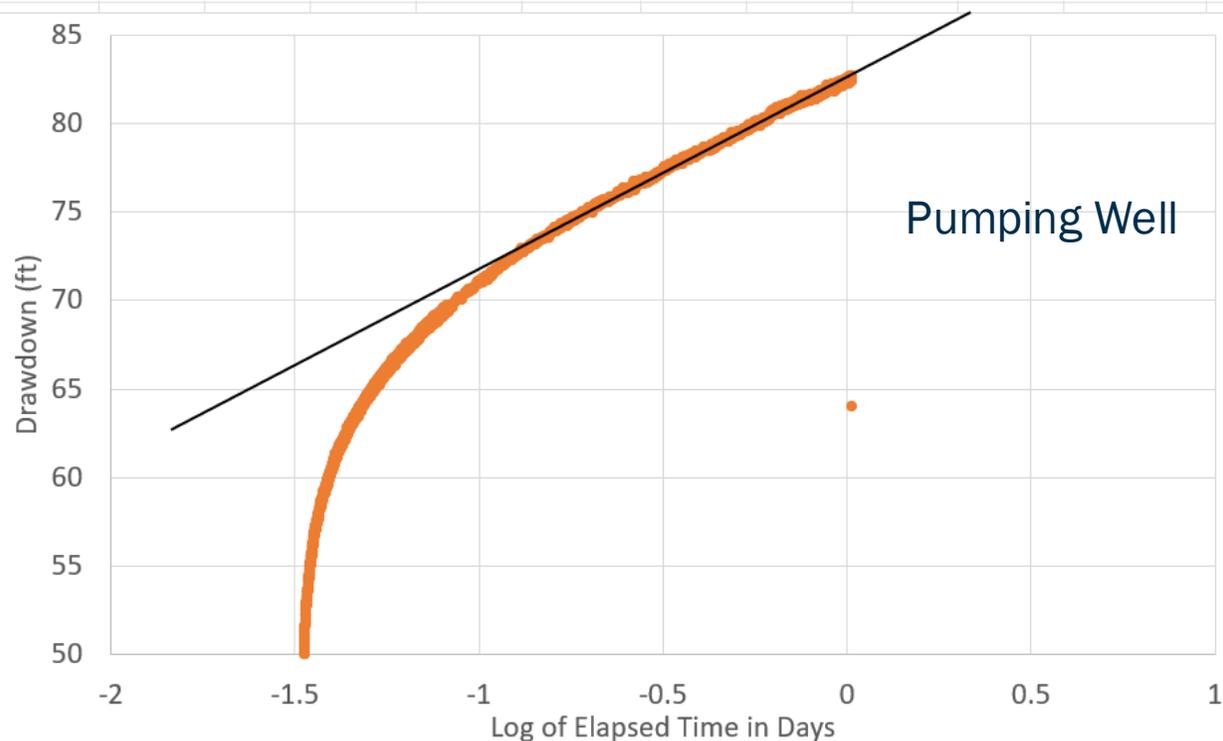

800			SHALE; medium, Gley 1 4/2, no odor, massive, no HCL reaction	800
805			SHALE; medium, Gley 1 4/1, no odor, massive, no HCL reaction	805
810			SHALE; medium, Gley 1 4/1, no odor, massive, no HCL reaction	810
815			SHALE; medium, 5Y 3/1 (very dark gray), no odor, massive, weak HCL reaction	815
820			SHALE; medium, 5Y 3/1 (very dark gray), no odor, massive, weak HCL reaction	820
825			SHALE; medium, 5Y 3/1 (very dark gray), no odor, massive, weak HCL reaction	825
830			SHALE; medium, 5Y 3/1 (very dark gray), no odor, massive, weak HCL reaction	830
835			SANDSTONE; fine grained, hard, 5Y 5/1 (gray), no odor, massive, no HCL reaction, 30% shale, Gley1 4/3	835
840			(CL), medium plasticity; 10YR 4/1 (dark gray), no odor, weak HCl reaction, weak cementation	840
845			(CL), medium plasticity; 10YR 4/1 (dark gray), no odor, weak HCl reaction, weak cementation	845
850			SHALE; medium, Gley 1 5/2, dry, no odor, massive, no HCL reaction	850
855			SHALE; medium, Gley 1 5/2, dry, no odor, massive, no HCL reaction	855
860			LIMESTONE; fine grained, hard, 5Y 7/1 (light gray), no odor, massive, strong HCL reaction, 30% shale, Gley1 4/3	860
865			LIMESTONE; fine grained, hard, 5Y 7/1 (light gray), no odor, massive, strong HCL reaction, 30% shale, Gley1 4/3	865
870			SHALE; fine grained, hard, Gley 1 4/, no odor, massive, strong HCL reaction, 4/5, 30% shale 10yr 3/1, 30% limestone 5y 7/1	870
875			SHALE; fine grained, hard, Gley 1 4/, no odor, massive, strong HCL reaction, 4/5, 30% shale 10yr 3/1, 30% limestone 5y 7/1	875
880			SHALE; medium, 5YR 3/3 (dark reddish brown), no odor, massive, no HCL reaction	880
885			SHALE; medium, 5YR 3/3 (dark reddish brown), no odor, massive, no HCL reaction	885
890			SHALE; medium, 5YR 3/3 (dark reddish brown), no odor, massive, no HCL reaction, 50% sandstone, fine grained, subs, 5y 6/1	890
895			SHALE; medium, 5YR 3/3 (dark reddish brown), no odor, massive, no HCL reaction, 50% sandstone, fine grained, subs, 5y 6/1	895
900			SANDSTONE; fine grained, hard, 5Y 7/1 (light gray) and Gley 1 4/2, no odor, no HCL reaction	900
905			SANDSTONE; fine grained, hard, 5Y 7/1 (light gray) and Gley 1 4/2, no odor, no HCL reaction	905
910			CALCAREOUS SHALE; medium, 5Y 5/1 (gray), no odor, strong HCL reaction, Sandy shale, no hcl, massive, fine grained, same color	910
915			CALCAREOUS SHALE; medium, 5Y 5/1 (gray), no odor, strong HCL reaction, Sandy shale, no hcl, massive, fine grained, same color	915
920			SANDSTONE; fine grained, medium, 5Y 6/2 (light olive gray) and 5Y 5/3 (olive), no odor, massive, no HCL reaction, 10% shale 5yr 3/3	920
925			SANDSTONE; fine grained, medium, 5Y 6/2 (light olive gray) and 5Y 5/3 (olive), no odor, massive, no HCL reaction, 10% shale 5yr 3/3	925
930			SANDSTONE; fine grained, medium, 5Y 6/2 (light olive gray) and 5Y 5/3 (olive), no odor, massive, no HCL reaction, 10% shale 5yr 3/3	930
935			SANDSTONE; fine grained, medium, 5Y 6/2 (light olive gray) and 5Y 5/3 (olive), no odor, massive, no HCL reaction, 10% shale 5yr 3/3	935
940			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	940
945			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	945
950			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	950
955			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	955
960			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	960
965			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	965
970			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	970
975			Well-Graded SAND (SW), fine to coarse grained, subrounded to subangular; no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 5 mm	975
980			Well-Graded SAND with Gravel (SW), fine to coarse grained, subrounded to subangular; trace (<5%) Gravel, fine grained; very loose, no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 15 mm	980
985			Well-Graded SAND with Gravel (SW), fine to coarse grained, subrounded to subangular; trace (<5%) Gravel, fine grained; very loose, no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 15 mm	985
990			Well-Graded SAND with Gravel (SW), fine to coarse grained, subrounded to subangular; trace (<5%) Gravel, fine grained; very loose, no odor, no HCl reaction, no cementation, grains are clear, brn, pink, orange, olive green, red, blk, max grain size 15 mm	990

Lithologic Log from Monitor Well Bottom 100'

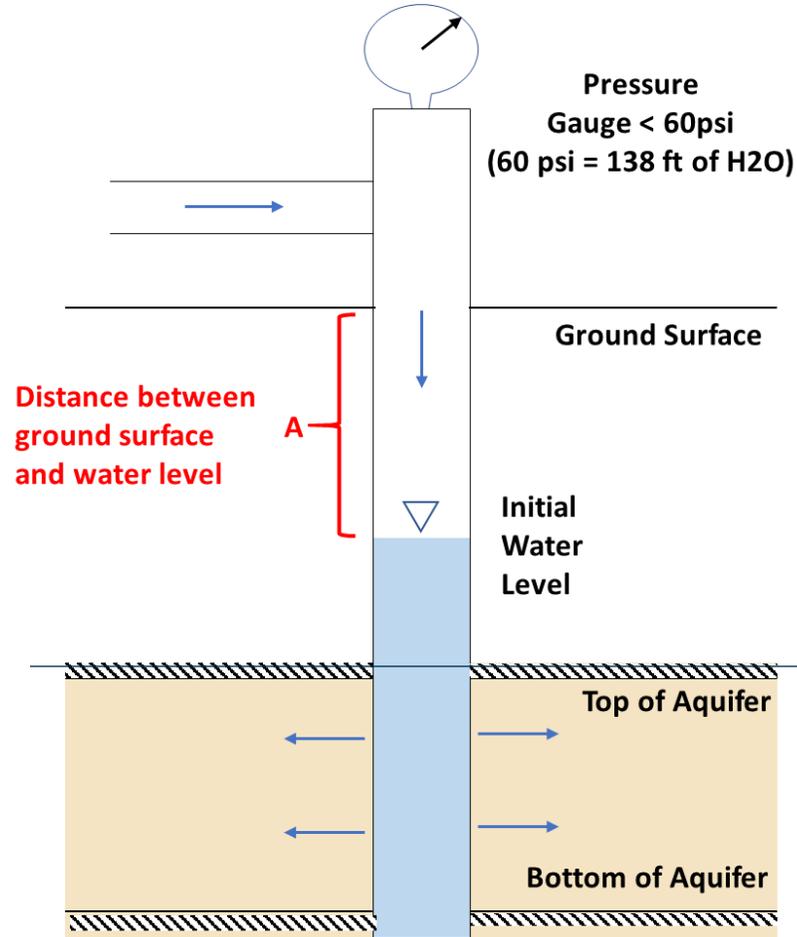

# Production Well

- 8" production well, SDR-17 PVC
- Well produced 250 gpm, estimated maximum around 400 gpm
- Hydraulic Conductivity = 10 ft/d
- Storativity =  $3.2 \times 10^{-5}$

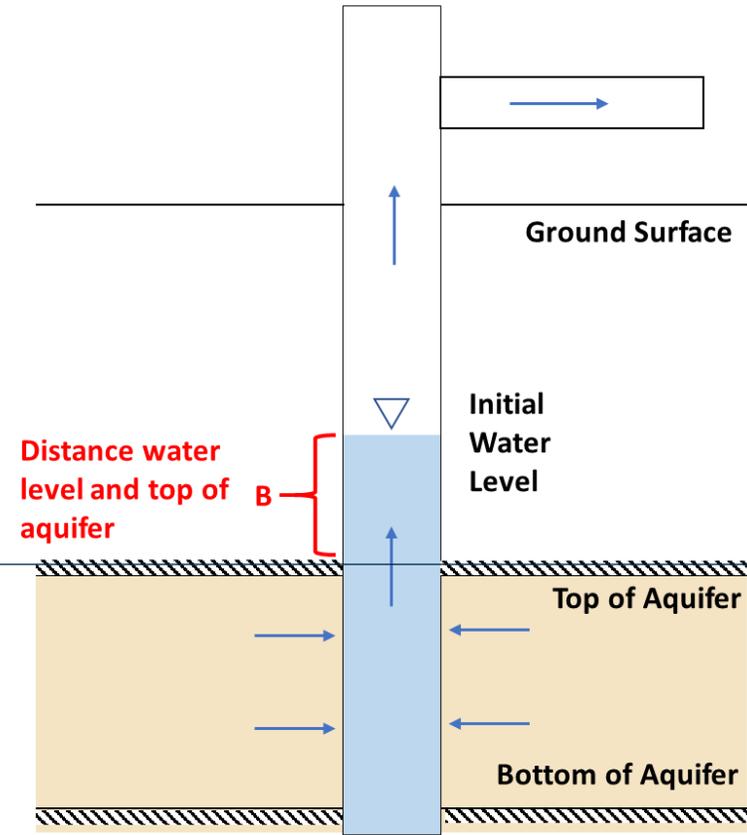

# ASR Hydraulics

### Injection Criterion

### Pumping Criterion

Injection Head <  $A + 138$  ft

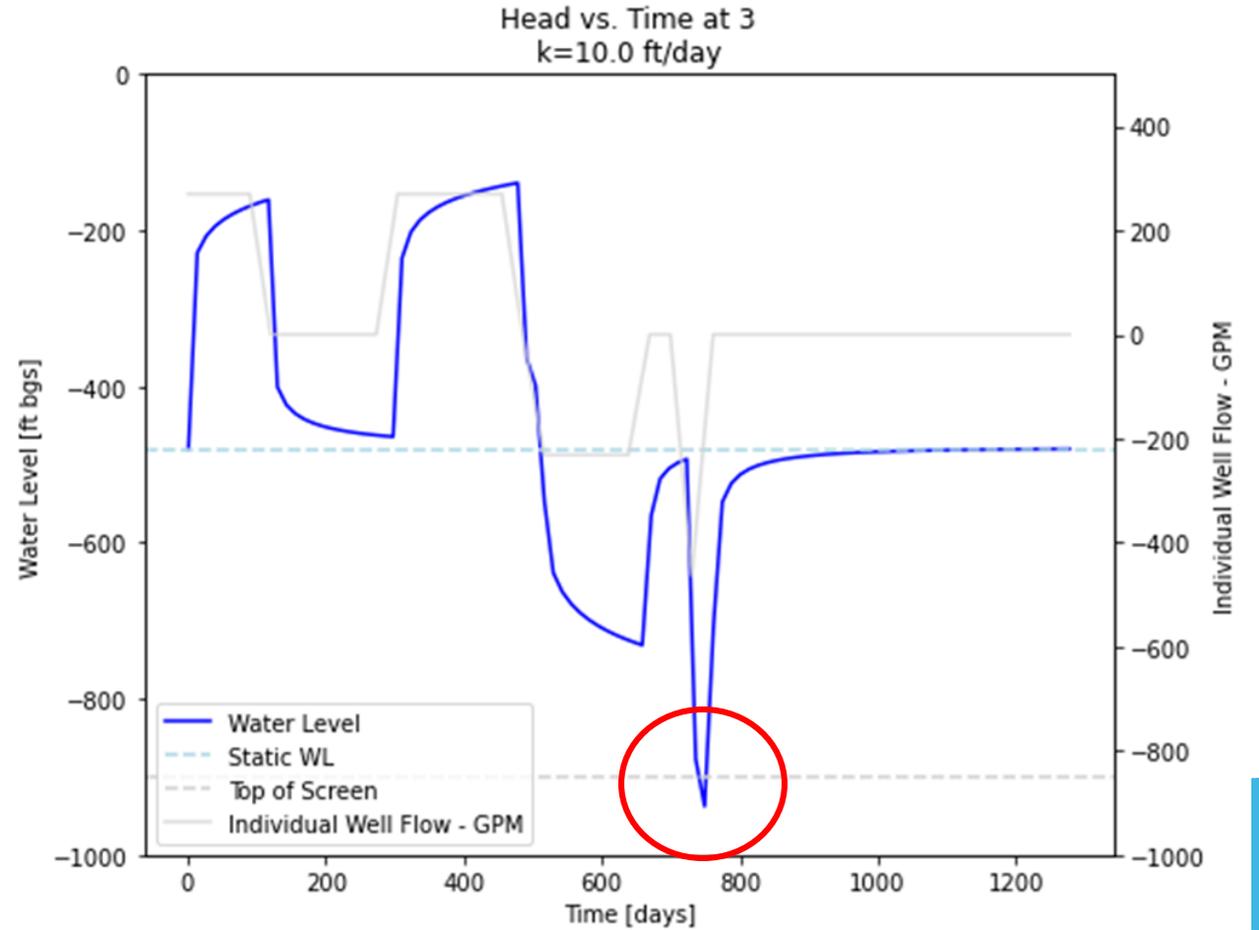

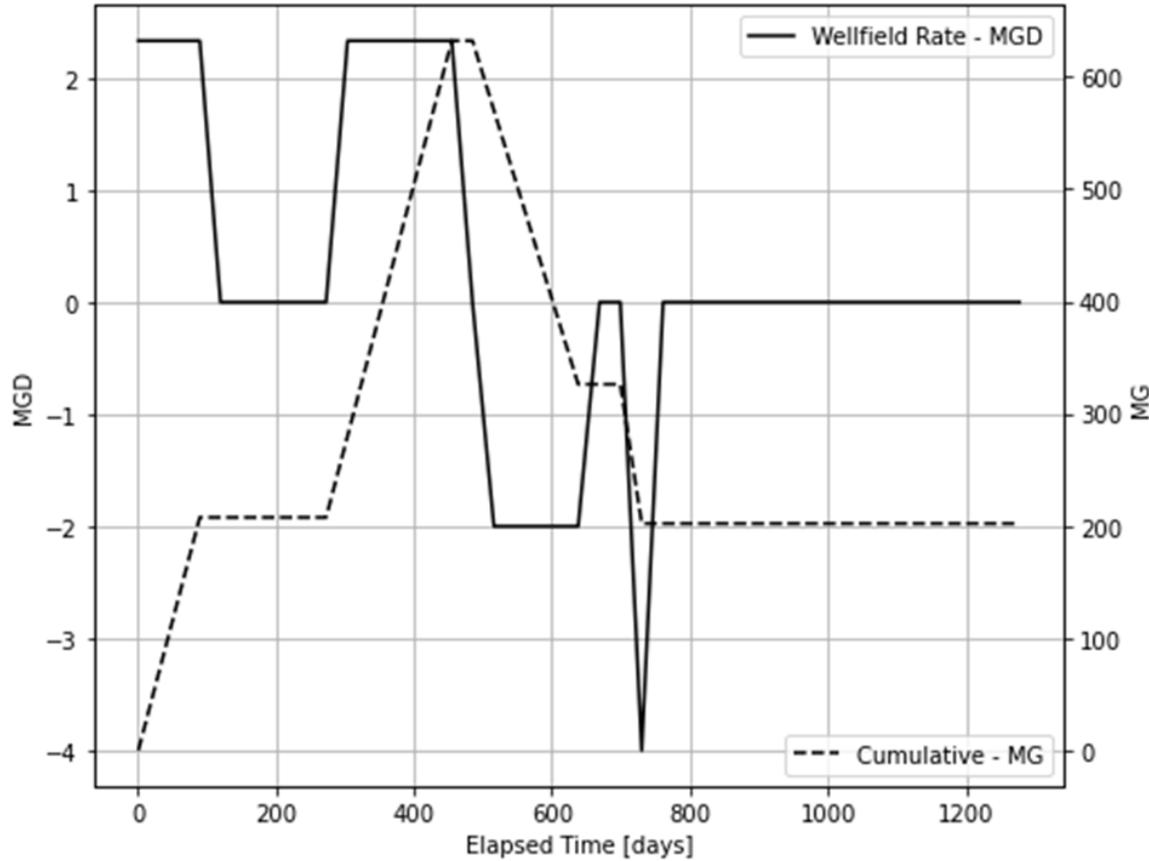

Pumping Drawdown < B

Lower Trinity top ~900 bgs

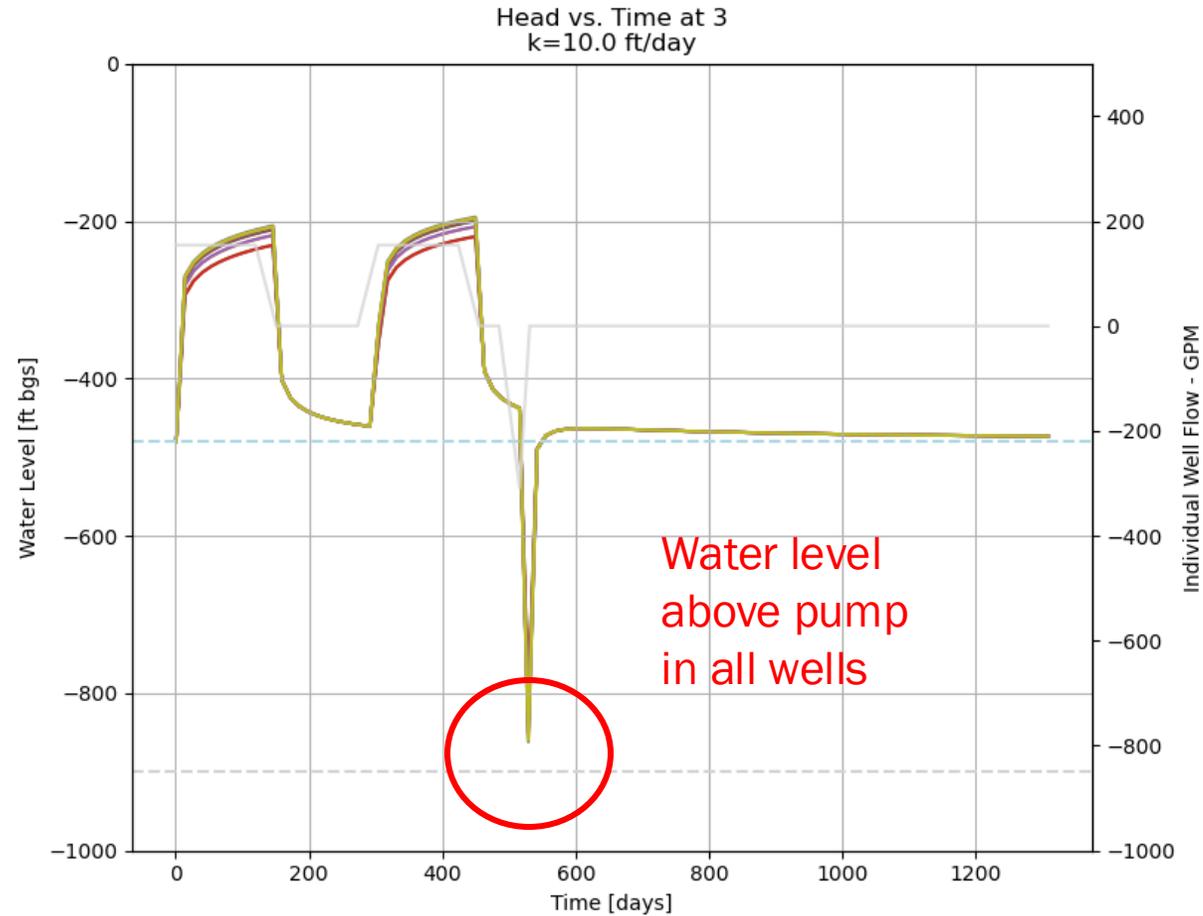

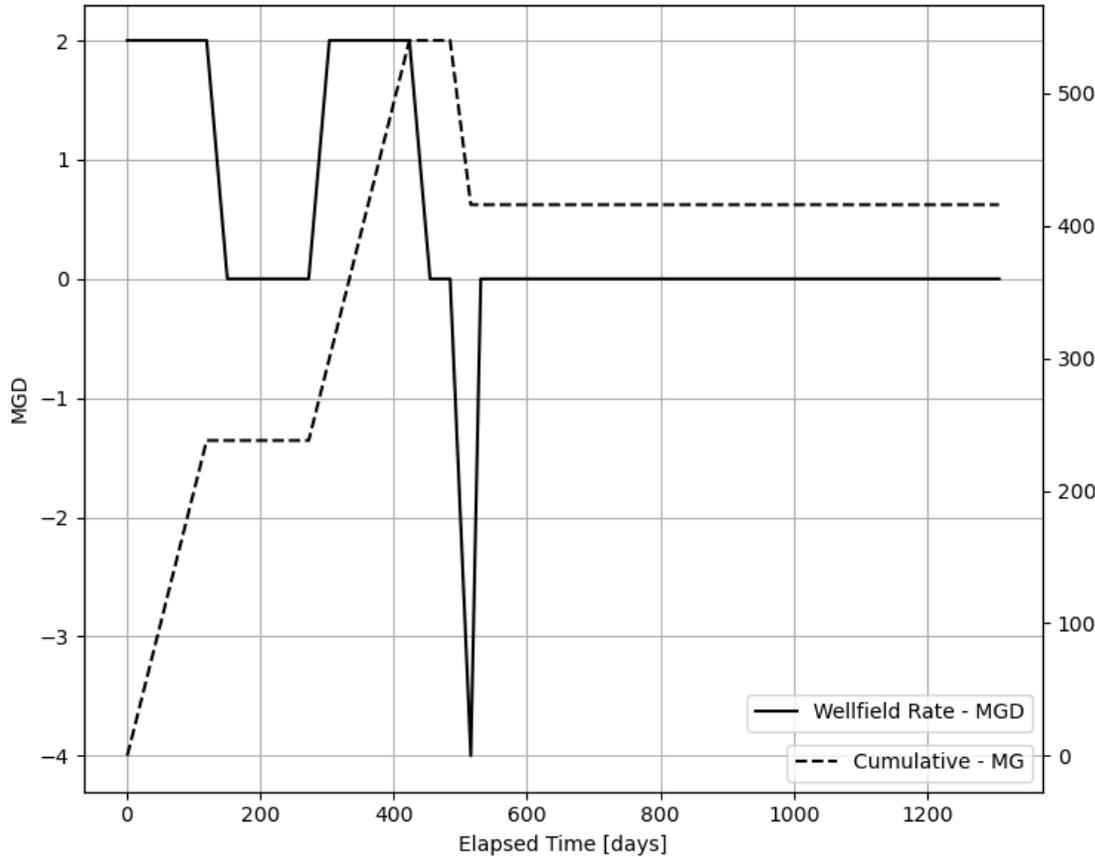

# Initial Configuration

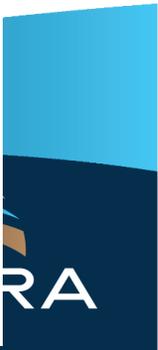

## 1,000 ft well spacing, 6 wells

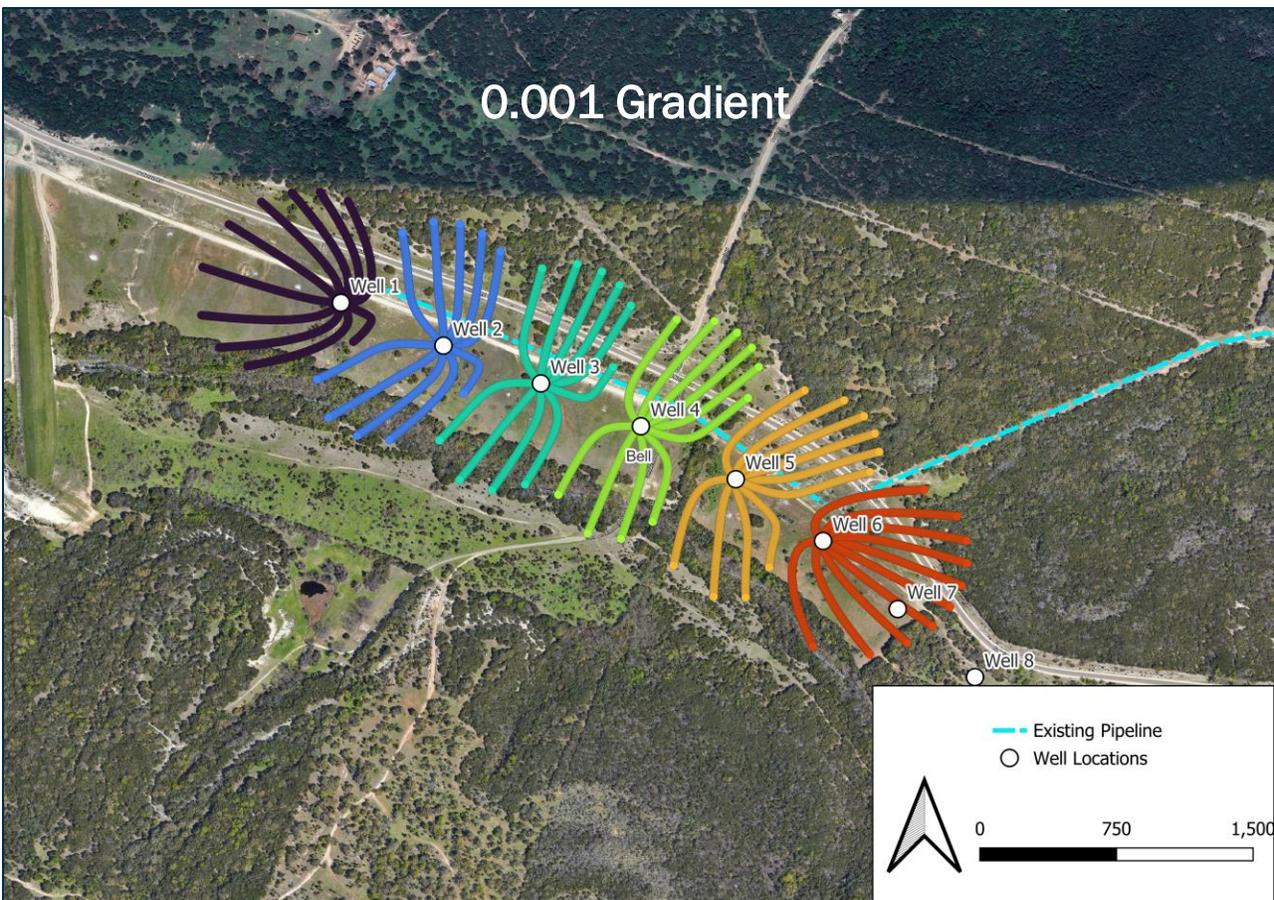

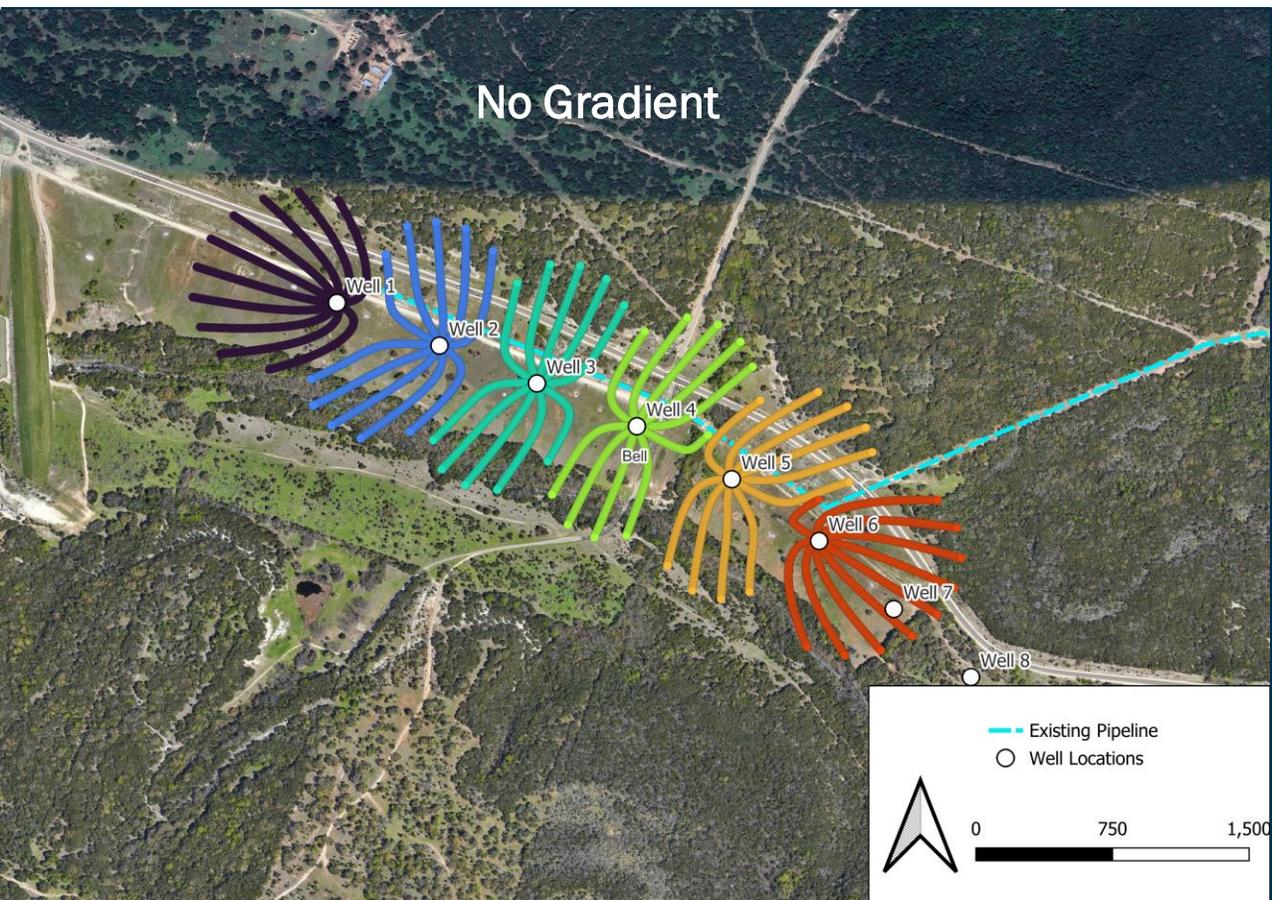

# Draft Final Configuration, 9 wells, 600 ft spacing

- Well 7 Water Level
- Well 8 Water Level
- Well 9 Water Level
- Well 1 Water Level
- Well 2 Water Level
- Well 3 Water Level
- Well 4 Water Level
- Well 5 Water Level
- Well 6 Water Level
- Static WL
- Top of Screen
- Individual Well Flow - GPM

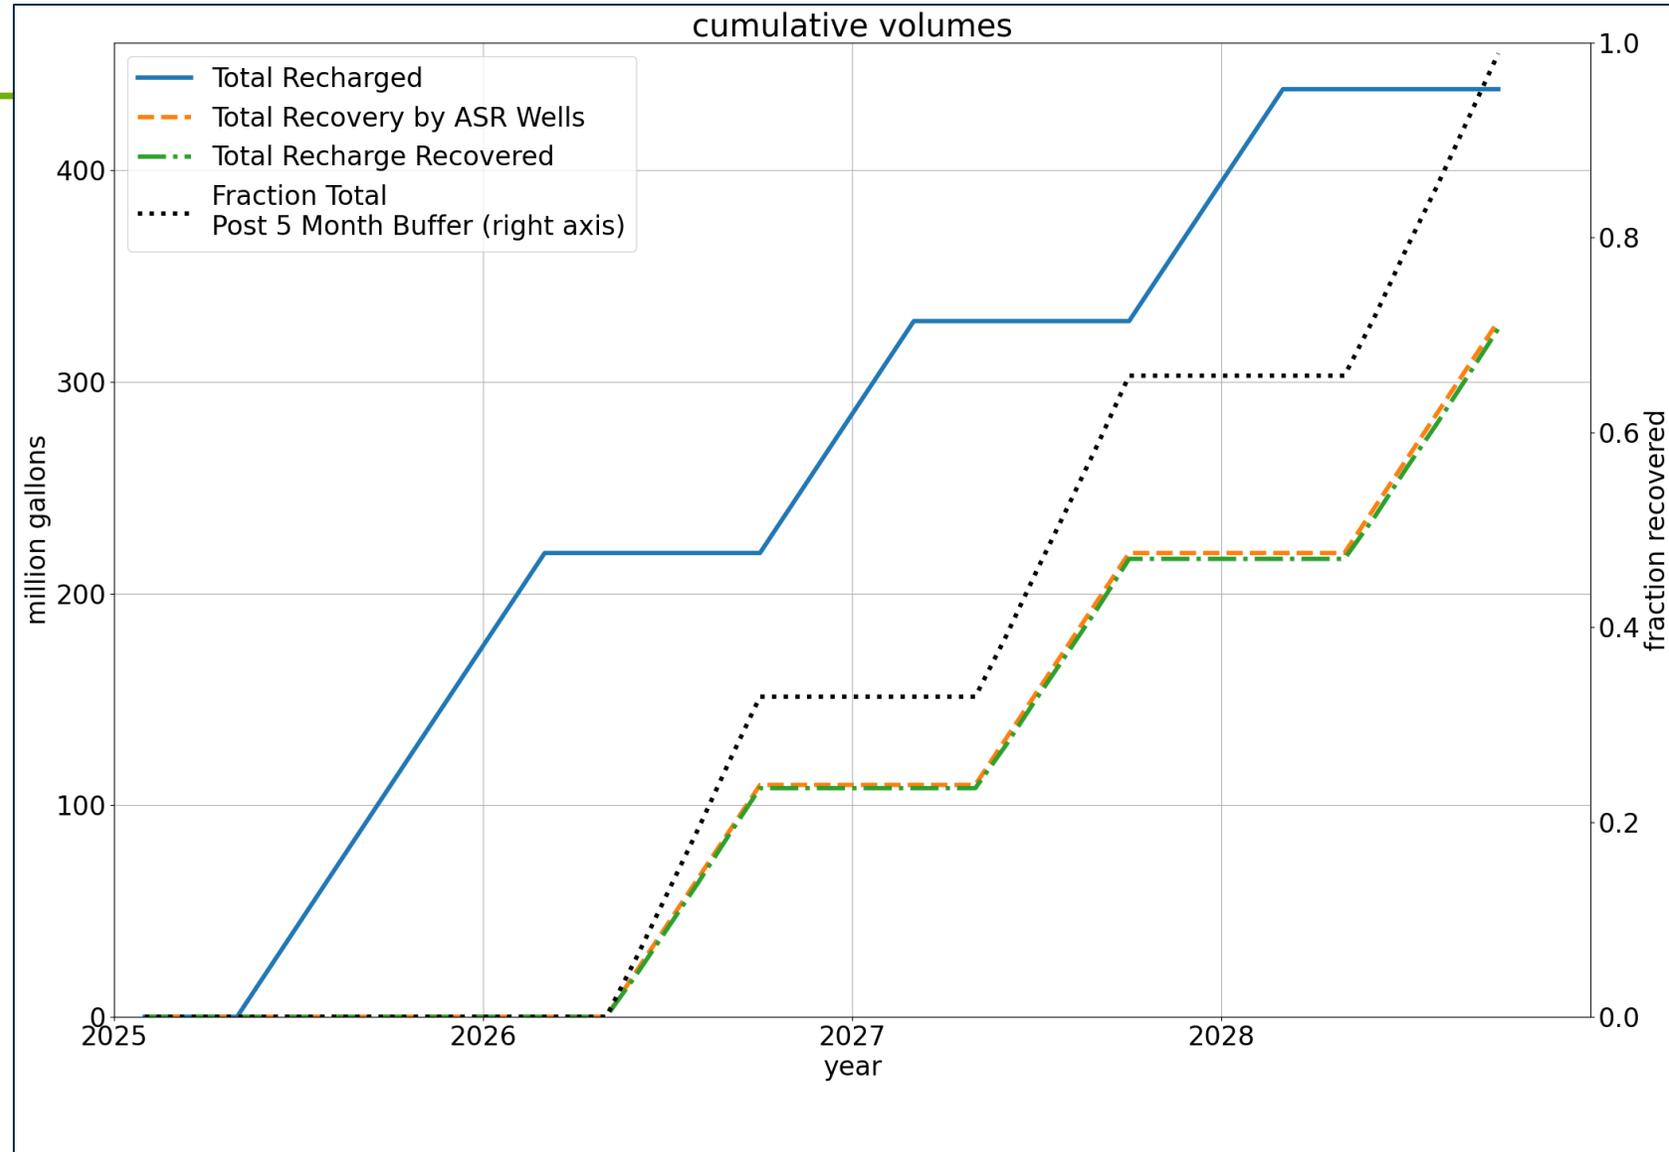

# Bubble Extent - 10 months continuous recharge at 2MGD (ASR Wells 1-6)

# Recoverability

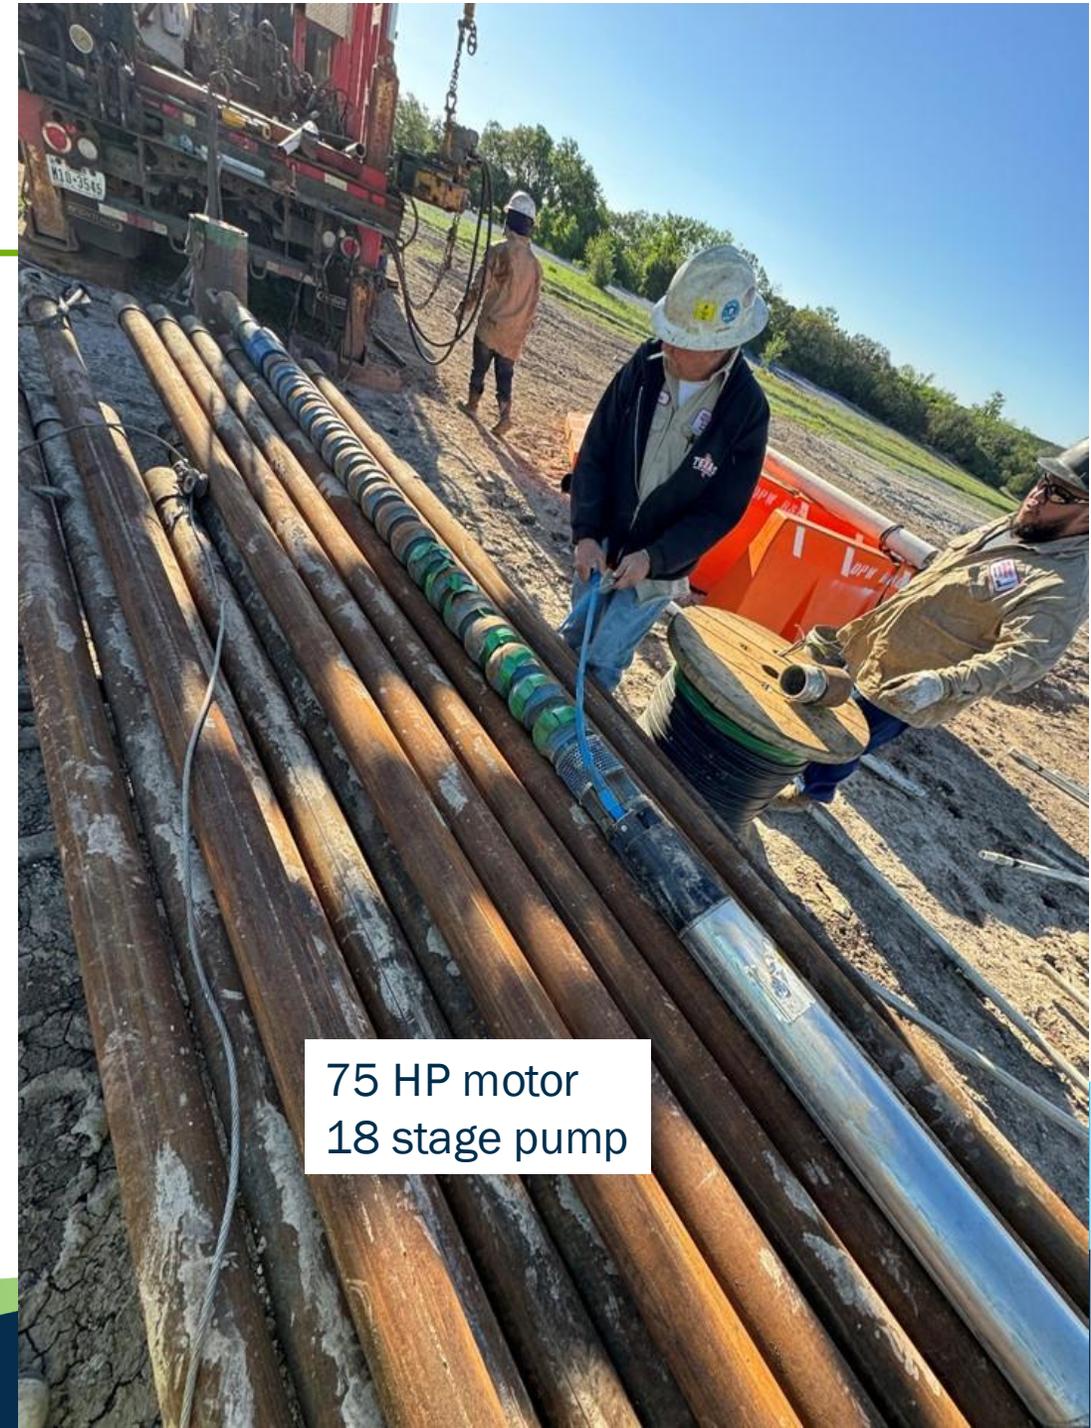

- Percent of recharge water that can be recovered during normal operation
- TCEQ permit requires and estimate of recoverability
- **IMPORTANT:** You cannot “over recover” past your permitted amount without an additional production permit from the groundwater conservation district

# Next Steps

---

- TCEQ Permit Package in Review at Agency
- Demonstration well construction
- Cycle testing program
- Full wellfield buildout

75 HP motor  
18 stage pump

# City of Temple

---

# City of Temple Well

---

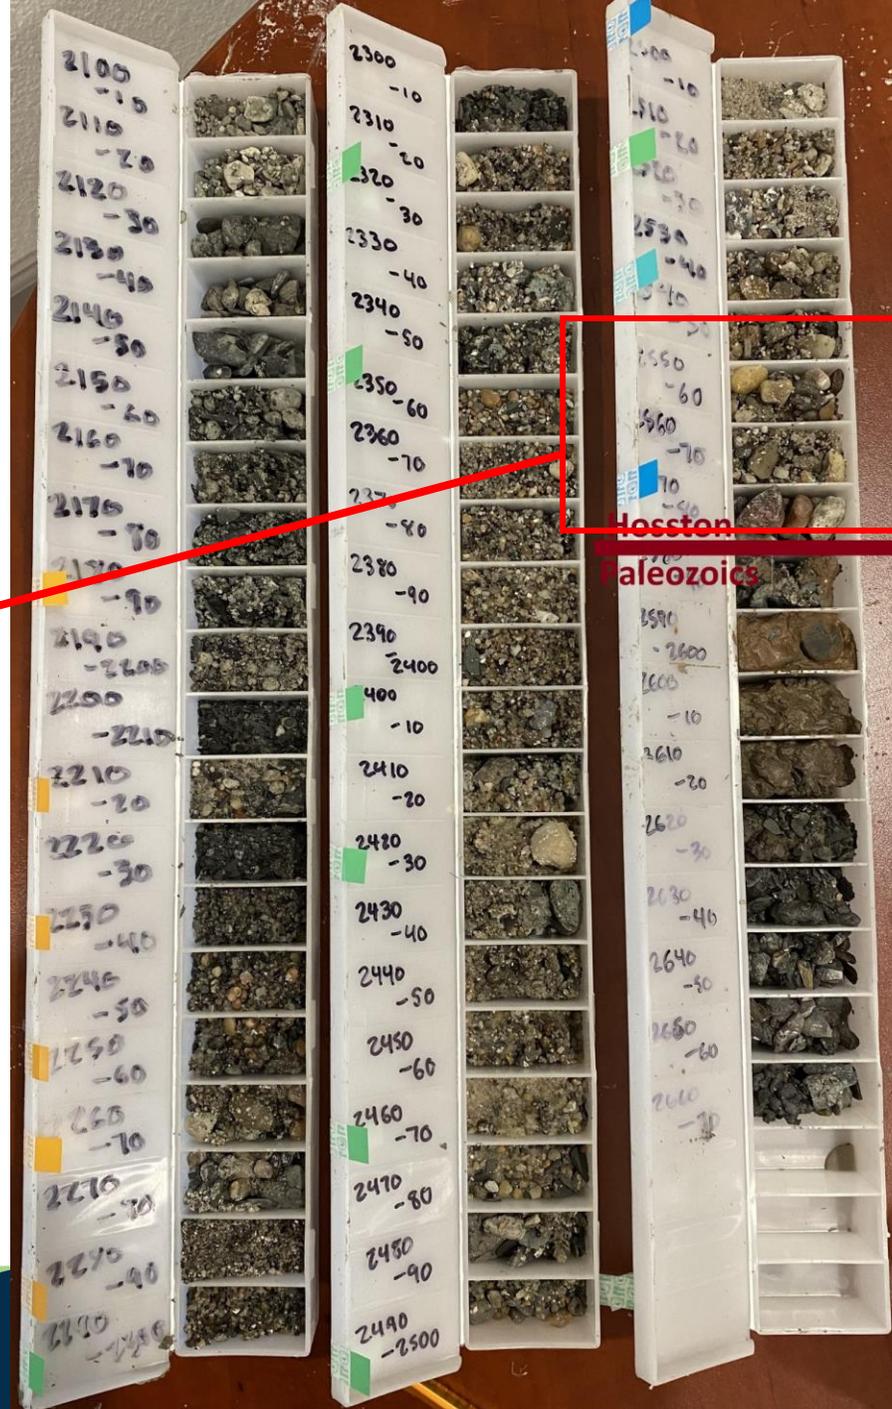

- Construct a Lower Trinity well to provide a water supply to an industrial partner (data center) southeast of town
- Construct well to meet UIC requirements for ASR (e.g. HSLA steel casing)
- Perform ASR feasibility study in parallel with well construction
- Potentially convert well to ASR in the future, with recycled water as a source

# Pilot Hole Findings

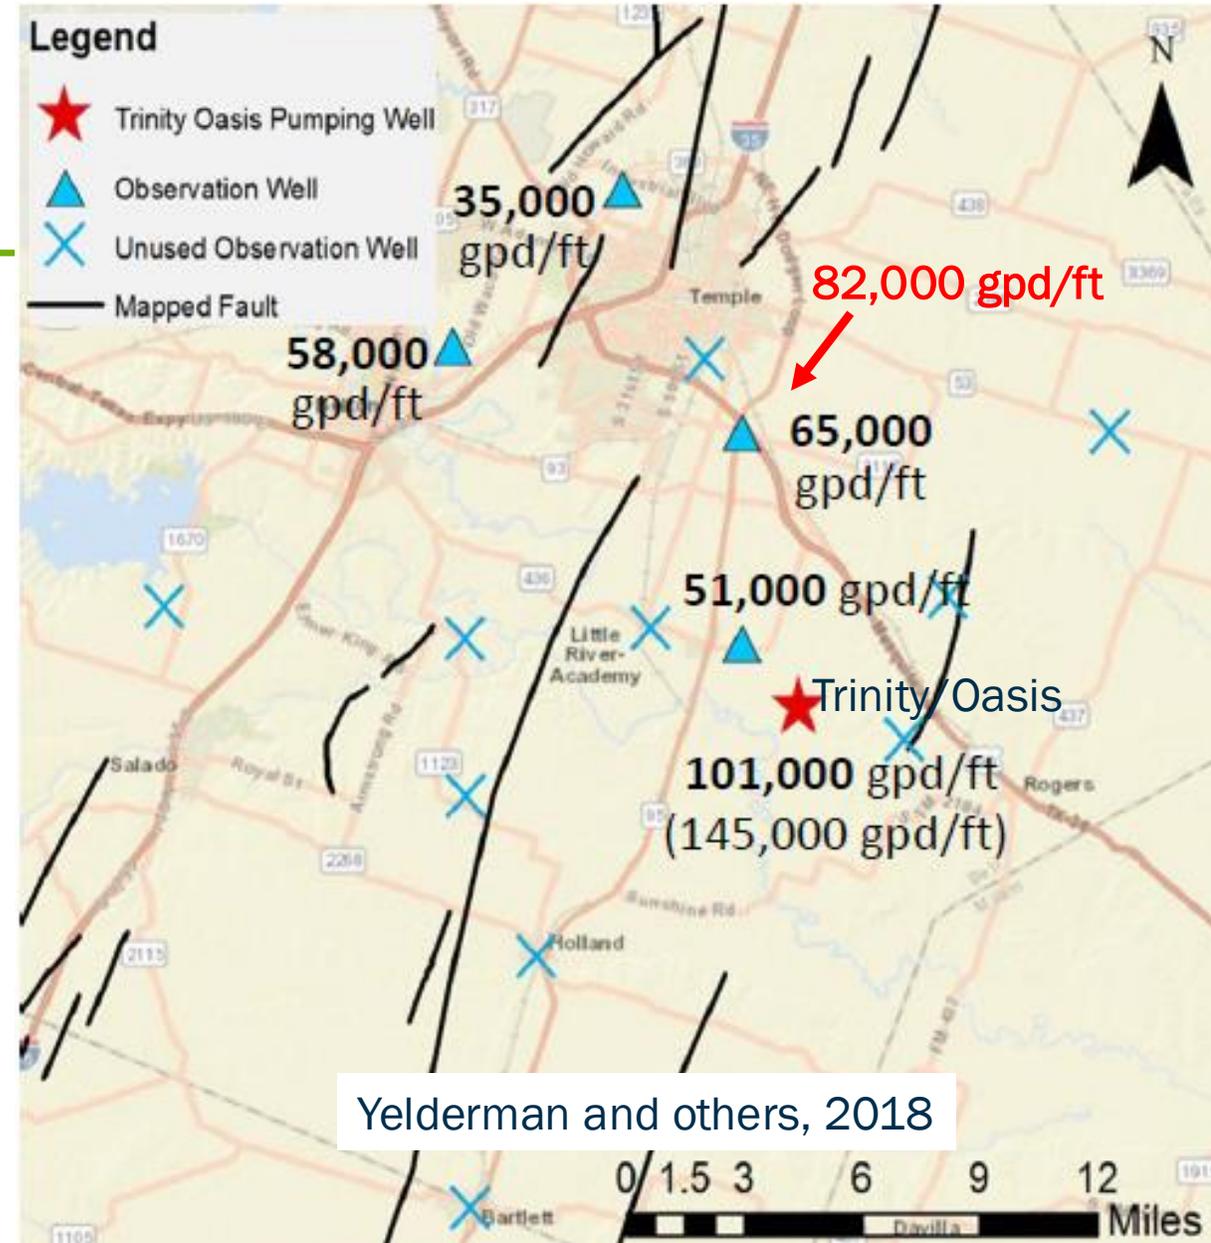

Thanks to Vince Clause for providing chip tray photos

Gravel!

# Well Performance

- Well was tested at 2,000+ gpm
- Transmissivity estimated at 11,000 ft<sup>2</sup>/d (82,000 gpd/ft)
- Temple will take over well, considering next steps for potential ASR

# Phased ASR Implementation

---

- Obtain ASR Authorization for Pilot Testing of Well 1 (ASR-1)
  - Full scale recharge and recovery cycles to confirm well hydraulics and any water quality changes
- Identify potential ASR well sites for an expanded system
  - Groundwater model tools
  - Infrastructure requirements

# ASR Model Scenarios

---

## Objectives

- Confirm workable ASR well locations to meet desired recharge and recovery objectives
- Compare available draw-up and drawdowns with model results
- Identify likely extent of ASR bubbles relative to property boundaries, whether the bubbles coalesce and any potential bubble migration that may impact recovered water quality

## Approach

- Agree recharge and recovery rates and schedule
- Predict water level changes
- Complete particle tracking simulations
- Assess multiple layout scenarios starting with agreed potential well locations

Scenario	Description
1	Two ASR Wells (2,000 ft spacing)
1B	Two ASR Wells (1,000 ft spacing)
2	Four ASR Wells (2,000 to 3,000 feet apart)
2B	Four ASR Wells (3 wells approx. 1,000 feet apart)
2C	Four ASR Wells, revised location for ASR-2

# Scenario 2 – Four ASR Wells

---

- Two ASR wells did not stress the aquifer!
- Three scenarios completed:
  - Scenario 2: using locations for ASR-1 (existing well), ASR-2, ASR-3 and ASR-4, approximate spacing 2,000 - 3,000 feet
  - Scenario 2B: revised with ASR-3 relocated between ASR-2 and ASR-4 to check increased hydraulic interference and potentially changed bubble geometry
  - Scenario 2C: revised with ASR-2 relocated 1,000 ft south of ASR-4 to accommodate land development
- Recharge and Recovery Rates and Volumes

Recharge / Recovery Rates per Well (GPM)	Combined Recharge Rate (MGD)	Annual Total Recharge /Recovery Volume (MG)	Combined Recovery Rate (MGD)
1,500/2,625	8.640	1814.4	15.120

# Scenario 2: Predicted Groundwater Heads

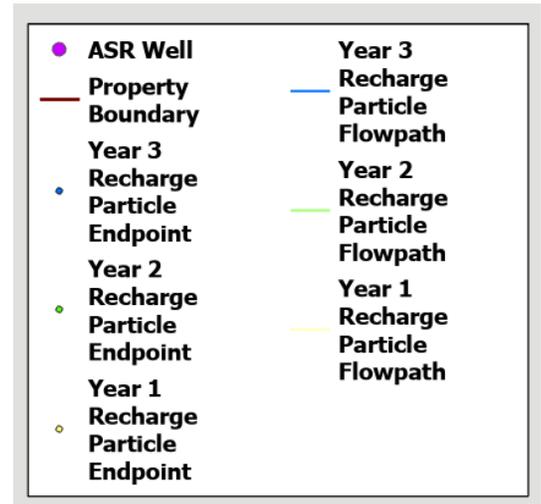

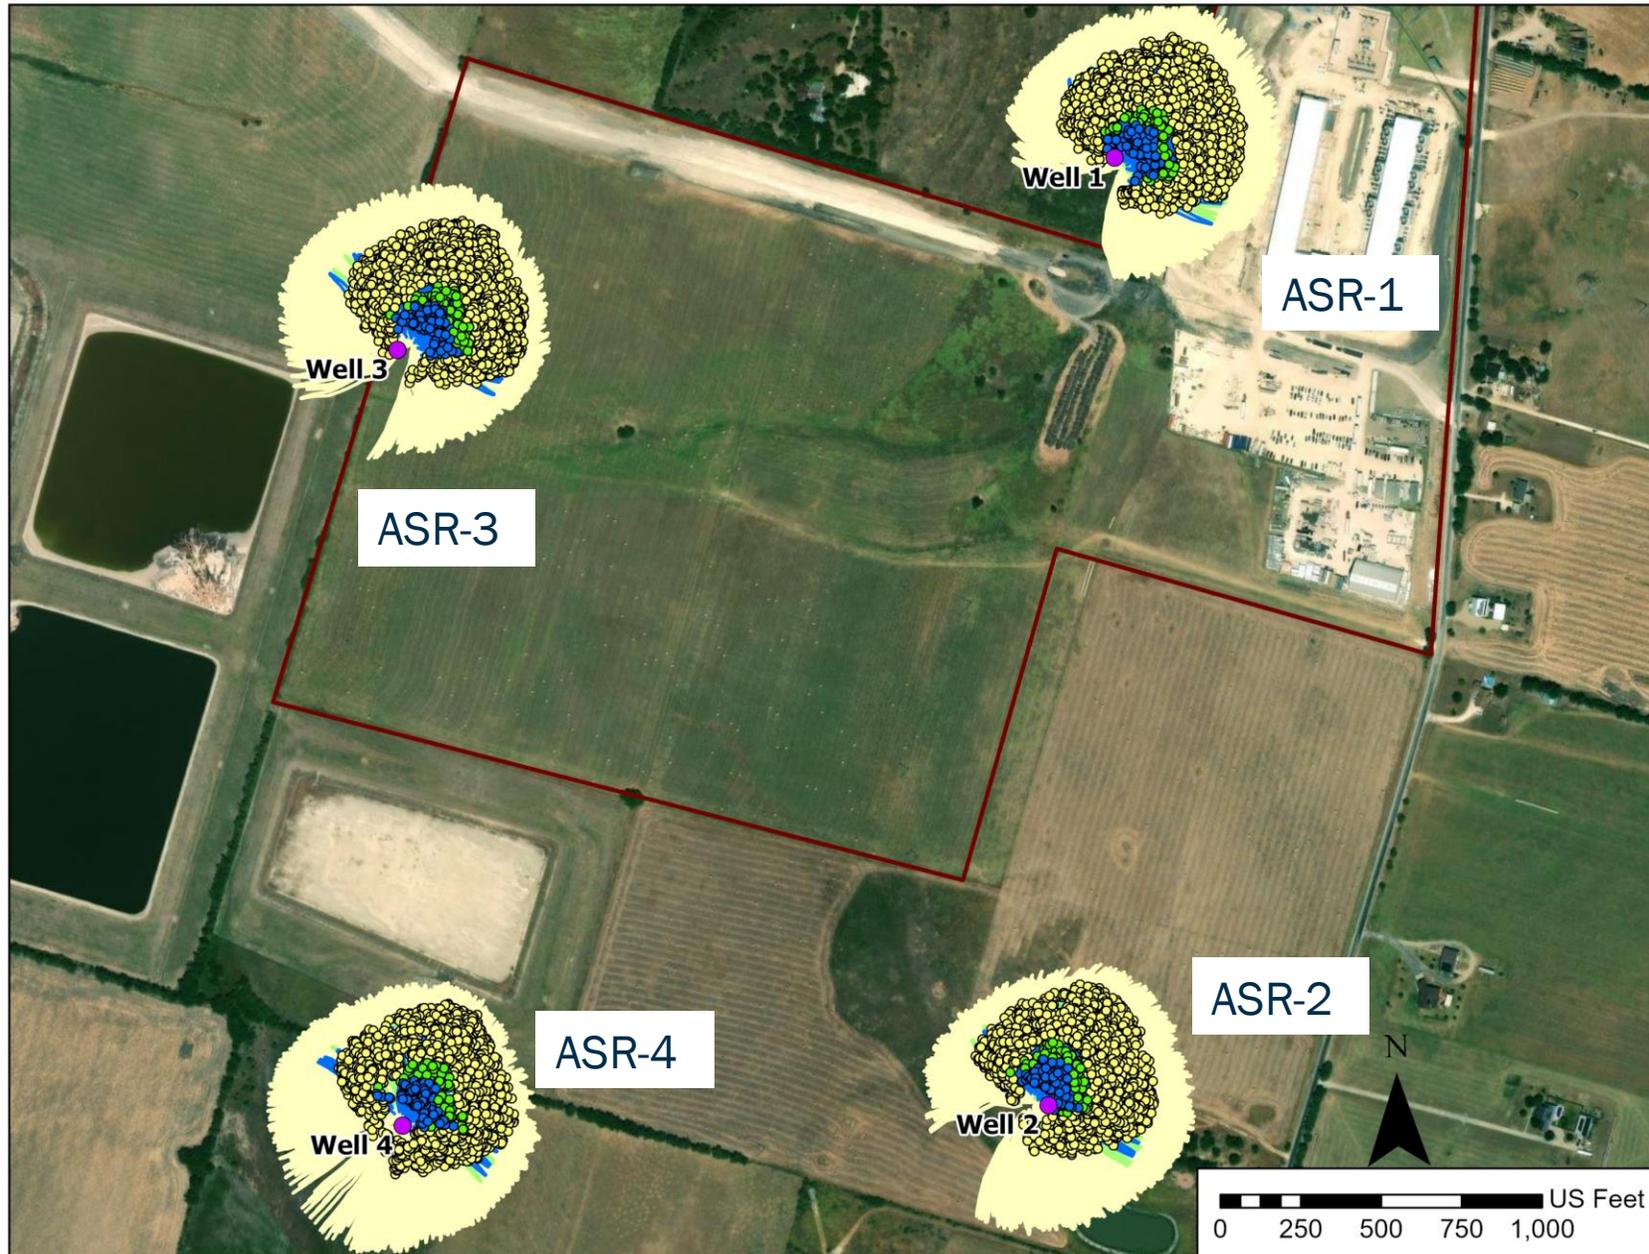

**Scenario 2: Four Active Wells**  
Max: 444 ft amsl ( 108 ft drawup)  
Min: 147 ft amsl ( 189 ft drawdown)

NOTE: Lowest Land Elevation is 564 ft amsl at Well #1 (Wells are generally between 565 to 590 ft amsl)  
Water Level: 328 ft. below land surface on 2024-06-22

## Scenario 2: Four Active Wells ASR-1,2,3,4 (2,000 to 3,000 ft apart)

### Key Observations:

- Similar results to Scenario 1 with twice the capacity (storage and rates)
- Slightly smaller buffer zone margin for ASR-4 (southwestern well)
- If recovered water quality is important additional recharge may be needed during later years

# Predicted ASR Bubble Geometry

For thick aquifer sequences large volumes can be stored, but the lateral extent of the recharged water may also be limited.

## Issues to consider:

- Recovered water quality may be impacted, especially if native groundwater is brackish
- Aquifers are not vertically homogenous, i.e. the edges of the stored water will be irregular meaning buffer zone development likely more important
- Any potential water quality changes from recharge likely to occur within a limited distance
- Improved opportunity for control of the recharged water within property boundaries

# Summary

---

- Hosston characteristics are different at the two locations, but both are viable for ASR
  - Up to 4 MGD recovery at Fort Hood site
  - Up to 15 MGD recovery at Temple site
- Hosston/Lower Trinity is a valuable aquifer for storing water
- Aquifer recharge is one solution for offsetting regional declines from production

---

Thank you!
